

DRAFT

APPENDIX B: RISK DATA SHEETS

Risk Title: Accelerated Bone Loss and Fracture Risk

Theme :	Human Health and Countermeasures (HH&C)	
Discipline :	Bone Loss	
Risk Number :	1	
Risk Description :	Failure to recover bone lost during mission coupled with age-related bone loss can lead to osteoporotic fractures at a younger age. Important for long duration missions for crew health and for designing rehabilitation strategies.	
Context/Risk Factors :	Age ; Baseline BMD ; Gender ; Muscle loss ; Nutrition	
RYG Risk Assessment :	<p>ISS: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Lunar: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p>	
Justification :	<p>ISS: TBD</p> <p>Lunar: TBD</p> <p>Mars: TBD</p>	
Current Countermeasures :	<p>ISS : Bisphosphonate ; Gravity-related exercise activity ; Nutrition ; Resistive exercise</p> <p>Lunar : Bisphosphonate ; Gravity-related exercise activity ; Nutrition ; Resistive exercise</p> <p>Mars : Bisphosphonate ; Gravity-related exercise activity ; Nutrition ; Resistive exercise</p>	
Projected Countermeasures :	<p>ISS : TBD</p> <p>Lunar : TBD</p> <p>Mars : TBD</p>	
Enabling Questions [With Mission Priority]:	No.	Question
	1a	What is the relative risk of sustaining a traumatic and/or stress fracture for a given decrement in bone mineral density or alteration in bone geometry in an astronaut-equivalent population who are physically active? [ISS 3, Lunar 5, Mars 1]
	1b	Will a period of rapid bone loss in hypogravity be followed by a slower rate of loss approaching a basal bone mineral density? What are the estimated site-specific fracture risks as one approaches this minimal BMD? [ISS 2, Lunar 5, Mars 1]
	1c	Is there an additive or synergistic effect of gonadal hormone deficiency in men or women on bone loss during prolonged exposure to hypogravity? [ISS 1, Lunar 5, Mars 5]
	1d	What pharmacological agent(s) will most effectively minimize the decrease in bone mass with extended exposure to hypogravity? [ISS 1, Lunar 5, Mars 1]
	1e	What are the specifics of the optimal exercise regimen with regard to mode, duration, intensity and frequency, to be followed during exposure to hypogravity so as to minimize decreases in bone mass? Is impact loading an essential element and, if so, how can it be produced in hypogravity? [ISS 1, Lunar 3, Mars 1]
	1f	What combination of exercise and a pharmacological agent(s) will prevent bone loss during exposure to hypogravity? [ISS 1, Lunar 5, Mars 1]

1g	What are the important predictors for estimating site-specific bone loss and fracture risk during hypogravity exposure, especially with reference to ethnicity, gender, age, baseline bone density and geometry, nutritional status, fitness level and prior microgravity exposure? [ISS 1, Lunar 5, Mars 1]
1h	Does the hypogravity environment change the nutritional requirements for optimal bone health? [ISS 3, Lunar 3, Mars 2]
1i	What diagnostic tools can be utilized during multi-year missions to monitor and quantify changes in bone mass and bone strength? [ISS 2, Lunar 5, Mars 1]
1j	What systemic adaptations to hypogravity are important contributory factors to bone loss, evaluations of which are essential to effective countermeasure development (e.g., fluid shifts, altered blood flow, immune system adaptations)? [ISS 3, Lunar 5, Mars 2]
1k	Are hypogravity-induced changes in bone density, geometry and architecture reversible upon encountering partial Gravity exposure, or on return to full gravity (1-G)? [ISS 1, Lunar 5, Mars 1]
1l	What regimen (exercise, pharmacological or biomechanical including impact loading or artificial gravity exposure) will most effectively hasten restoration of bone mass and bone strength (geometry and architecture) to pre-flight values in returning crewmembers? [ISS 2, Lunar 5, Mars 2]

Risk Title: Impaired Fracture Healing

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Bone Loss

Risk Number :	2														
Risk Description :	Bone fractures incurred during and immediately after long duration space flight can be expected to require a prolonged period for healing, and the bone may be incompletely restored, owing to the changes in bone metabolism associated with space flight.														
Context/Risk Factors :	Nutritional environment ; Rapid bone loss is progressive ; Risk factors will differ for major skeletal fracture vs. minor ; Stress related fractures ; Work environment														
RYG Risk Assessment :	<p>ISS: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Lunar: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Mars: ■ Red Unacceptable risk of serious adverse health or performance consequences; there is no mitigation strategy that has been validated in space or demonstrated on Earth.</p>														
Justification :	<p>ISS: Major fracture-Operational disruption for prolonged time. Minor fracture site-Minor operational disruption.</p> <p>Lunar: Major fracture-Operational disruption for prolonged time. Minor fracture site-Minor operational disruption.</p> <p>Mars: Major fracture-Operational disruption for prolonged time, fracture-related complications including immobility might risk death. Minor fracture site-Minor operational disruption Minor fracture site-Minor operational disruption</p>														
Current Countermeasures :	<p>ISS : Major fracture-return crew (ISS and Moon) ; Minimize bone loss to lessen fracture risk ; Orthopedic procedures ; Rehabilitation procedures ; Ultrasound and electrical stimulation</p> <p>Lunar : Major fracture-return crew (ISS and Moon) ; Minimize bone loss to lessen fracture risk ; Orthopedic procedures ; Rehabilitation procedures ; Ultrasound and electrical stimulation</p> <p>Mars : Minimize bone loss to lessen fracture risk ; Orthopedic procedures ; Possibly biochemical/pharmacological intervention to hasten fracture healing for Mars ; Rehabilitation procedures ; Ultrasound and electrical stimulation</p>														
Projected Countermeasures :	<p>ISS : Biomechanical measure to promote healing in relatively short time frame</p> <p>Lunar : Application of novel locally active agents to facilitate fracture healing in concert with biomechanical stimulation</p> <p>Mars : Application of novel locally active agents to facilitate fracture healing in concert with biomechanical stimulation</p>														
Enabling Questions [With Mission Priority]:	<table border="1"> <thead> <tr> <th>No.</th> <th>Question</th> </tr> </thead> <tbody> <tr> <td>2a</td> <td>Is the rate of fracture healing and the integrity of the healed fracture altered under microgravity or unloaded conditions? [ISS 1, Lunar 1, Mars 1]</td> </tr> <tr> <td>2b</td> <td>Are there site-specific differences, or differences in healing diaphyseal bone versus metaphyseal bone under microgravity or partial-gravity conditions? [ISS 3, Lunar 3, Mars 3]</td> </tr> <tr> <td>2c</td> <td>Which cellular and biochemical changes in bone cell biology alter fracture healing under microgravity conditions? [ISS 4, Lunar 4, Mars 4]</td> </tr> <tr> <td>2d</td> <td>Does the presence of microgravity-induced alteration in bone remodeling and/or osteoporosis affect fracture callus remodeling? [ISS 2, Lunar 2, Mars 2]</td> </tr> <tr> <td>2e</td> <td>How does altered muscle biology contribute to altered fracture healing in microgravity? [ISS 4, Lunar 4, Mars 4]</td> </tr> <tr> <td>2f</td> <td>Do biophysical modalities play a role in improving fracture healing in a microgravity environment? [ISS 2, Lunar 2, Mars 2]</td> </tr> </tbody> </table>	No.	Question	2a	Is the rate of fracture healing and the integrity of the healed fracture altered under microgravity or unloaded conditions? [ISS 1, Lunar 1, Mars 1]	2b	Are there site-specific differences, or differences in healing diaphyseal bone versus metaphyseal bone under microgravity or partial-gravity conditions? [ISS 3, Lunar 3, Mars 3]	2c	Which cellular and biochemical changes in bone cell biology alter fracture healing under microgravity conditions? [ISS 4, Lunar 4, Mars 4]	2d	Does the presence of microgravity-induced alteration in bone remodeling and/or osteoporosis affect fracture callus remodeling? [ISS 2, Lunar 2, Mars 2]	2e	How does altered muscle biology contribute to altered fracture healing in microgravity? [ISS 4, Lunar 4, Mars 4]	2f	Do biophysical modalities play a role in improving fracture healing in a microgravity environment? [ISS 2, Lunar 2, Mars 2]
No.	Question														
2a	Is the rate of fracture healing and the integrity of the healed fracture altered under microgravity or unloaded conditions? [ISS 1, Lunar 1, Mars 1]														
2b	Are there site-specific differences, or differences in healing diaphyseal bone versus metaphyseal bone under microgravity or partial-gravity conditions? [ISS 3, Lunar 3, Mars 3]														
2c	Which cellular and biochemical changes in bone cell biology alter fracture healing under microgravity conditions? [ISS 4, Lunar 4, Mars 4]														
2d	Does the presence of microgravity-induced alteration in bone remodeling and/or osteoporosis affect fracture callus remodeling? [ISS 2, Lunar 2, Mars 2]														
2e	How does altered muscle biology contribute to altered fracture healing in microgravity? [ISS 4, Lunar 4, Mars 4]														
2f	Do biophysical modalities play a role in improving fracture healing in a microgravity environment? [ISS 2, Lunar 2, Mars 2]														

	2g	Do biophysical modalities play a role in improving fracture healing in the presence of bone loss in a microgravity environment? [ISS 2, Lunar 2, Mars 2]
	2h	Are there anabolic agents, growth factors or cytokines that will speed fracture repair during microgravity, in combination with active bone loss due to unloading? [ISS 1, Lunar 1, Mars 1]
	2i	What technologies will be used to diagnose fractures of the axial and appendicular skeleton in a space environment? [ISS 1, Lunar 1, Mars 1]
	2j	Will different technologies be needed to treat either open or closed fractures in a space environment? [ISS 1, Lunar 1, Mars 1]

Risk Title: Injury to Joints and Intervertebral Structures

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Bone Loss
Risk Number :	3
Risk Description :	Fascia, tendon and ligament overuse or traumatic injury, joint dysfunction upon return to normal/partial gravity. Hypogravity changes to intervertebral discs may increase risk of rupture, with attendant back pain, possible neurological complications.
Context/Risk Factors :	Age ; Muscle and tendon loss of mechanical strength ; Prior conditioning status ; Prior history of injuries ; Work related impact on intervertebral disc structures
RYG Risk Assessment :	ISS: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space. Lunar: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space. Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.
Justification :	ISS: High likelihood/Moderate consequence. Lunar: High likelihood/Moderate consequence. Mars: High likelihood/Moderate consequence.
Current Countermeasures :	ISS : Musculoskeletal Fitness ; Post-injury Rehabilitation ; Work injury avoidance patterns Lunar :

	Musculoskeletal Fitness ; Post-injury Rehabilitation ; Work injury avoidance patterns Mars : Musculoskeletal Fitness ; Post-injury Rehabilitation ; Work injury avoidance patterns										
Projected Countermeasures :	ISS : Coordinated muscle/tendon/ligament conditioning program Lunar : Coordinated muscle/tendon/ligament conditioning program Mars : Coordinated muscle/tendon/ligament conditioning program										
Enabling Questions [With Mission Priority]:	<table border="1"> <thead> <tr> <th>No.</th> <th>Question</th> </tr> </thead> <tbody> <tr> <td>3a</td> <td>What is the cause of the back pain commonly experienced by crewmembers upon return to 1-G? [ISS 2, Lunar 3, Mars 2]</td> </tr> <tr> <td>3b</td> <td>Is damage to joint structure or intervertebral discs incurred during or following hypogravity exposure? Risk Title: Renal Stone Formation

Theme :	Human Health and Countermeasures (HH&C)								
Discipline :	Bone Loss								
Risk Number :	4								
Risk Description :	Urine calcium concentration is increased due to increased bone resorption during hypogravity and to decreased urine volume during periods of dehydration.								
Context/Risk Factors :	Altered renal function ; Calcium loss from bone ; Fluid and mineral imbalance ; Impact of extended environmental features regarding mineral/fluid alterations ; Individual propensity for urine calcium oxalate solubility patterns								
RYG Risk Assessment :	<p>ISS: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Lunar: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Mars: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p>								
Justification :	<p>ISS: TBD</p> <p>Lunar: TBD</p> <p>Mars: TBD</p>								
Current Countermeasures :	<p>ISS : K Citrate ; Maintained hydration</p> <p>Lunar : K Citrate ; Maintained hydration</p> <p>Mars : K Citrate ; Maintained hydration</p>								
Projected Countermeasures :	<p>ISS : K Mg Citrate currently in testing in flight ; Ultrasound of renal status to anticipate renal stone formation ; Urine solubility testing in flight</p> <p>Lunar : K Mg Citrate currently in testing in flight ; Ultrasound of renal status to anticipate renal stone formation ; Urine solubility testing in flight</p> <p>Mars : K Mg Citrate currently in testing in flight ; Ultrasound of renal status to anticipate renal stone formation ; Urine solubility testing in flight</p>

Risk Title: Occurrence of Serious Cardiovascular Dysrhythmias

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Cardiovascular Alterations
Risk Number :	5
Risk Description :	Cardiac dysrhythmias pose a potentially lethal risk during long-duration space flight. Cardiac dysrhythmias may also cause hypotension and syncope. Cause is unknown.
Context/Risk Factors :	Altered neural and hormonal regulation ; Diminished cardiac mass and cardiac remodeling, flight duration ; Gender ; Possible risk factors include fluid and electrolyte imbalance ; Pre-existing cardiovascular disease ; Radiation exposure
RYG Risk Assessment :	<p>ISS: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Lunar: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p>
Justification :	<p>ISS: Serious cardiac rhythm disturbances including ventricular tachycardia have been observed on several occasions during space flight including a documented 14-beat run of ventricular tachycardia during a</p>

	<p>Mir mission. Recent flight and ground-based data demonstrate alterations in cardiac electrical activity, which may indicate altered cardiac electrical stability. If space flight increases the risk of serious cardiac dysrhythmias this could lead to syncope and/or death posing risk both to crewmembers and to the mission.</p> <p>Lunar: Serious cardiac rhythm disturbances including ventricular tachycardia have been observed on several occasions during space flight including a documented 14-beat run of ventricular tachycardia during a Mir mission. Risk Title: Diminished Cardiac and Vascular Function

Theme :	Human Health and Countermeasures (HH&C)				
Discipline :	Cardiovascular Alterations				
Risk Number :	6				
Risk Description :	Short-duration space flight has been associated with a decrease in cardiac mass. Long-duration space flight may result in greater decrease in cardiac mass and additional alterations that may diminish cardiac function, aggravate underlying cardiovascular disease (e.g., arterial atherosclerosis) leading to myocardial infarction, stroke or heart rhythm disturbances that could be irreversible.				
Context/Risk Factors :	Altered neural and hormonal regulation ; Flight duration ; Gender				
RYG Risk Assessment :	<p>ISS: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Lunar: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p>				
Justification :	<p>ISS: Ground based and flight data in humans and animals suggest that prolonged exposure to microgravity may lead to the reduction of cardiac mass and reduced cardiac function, although different studies have come to different conclusions in this regard. Carefully controlled studies from very long-duration to microgravity are required to definitively resolve this issue.</p> <p>Lunar: Ground based and flight data in humans and animals suggest that prolonged exposure to microgravity may lead to the reduction of cardiac mass and reduced cardiac function, although different studies have come to different conclusions in this regard. Carefully controlled studies from very long-duration to microgravity are required to definitively resolve this issue.</p> <p>Mars: Ground based and flight data in humans and animals suggest that prolonged exposure to microgravity may lead to the reduction of cardiac mass and reduced cardiac function, although different studies have come to different conclusions in this regard. Carefully controlled studies from very long-duration to microgravity are required to definitively resolve this issue.</p>				
Current Countermeasures :	<p>ISS : Exercise</p> <p>Lunar : Exercise</p> <p>Mars : Exercise</p>				
Projected Countermeasures :	<p>ISS : Artificial G exposure ; Drugs that affect cardiac mass and function</p> <p>Lunar : Artificial G exposure ; Drugs that affect cardiac mass and function</p> <p>Mars : Artificial G exposure ; Drugs that affect cardiac mass and function</p>

Risk Title: Define Acceptable Limits for Contaminants in Air and Water

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Environmental Health
Risk Number :	7
Risk Description :	Lack of information needed to set requirements for air and water quality. This includes inadequate information about: 1) sources of contaminants; 2) identification of potential contaminants; and 3) bases for setting acceptability limits for individual contaminants and combinations of contaminants.
Context/Risk Factors :	Remoteness: Crew health/susceptibility to degree of system closure
RYG Risk Assessment :	<p>ISS: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Lunar: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Mars: ■ Red Unacceptable risk of serious adverse health or performance consequences; there is no mitigation strategy that has been validated in space or demonstrated on Earth.</p>

Justification :	<p>ISS: Excessive pollutant levels (including microbial contaminants) can jeopardize crew health and/or impair mission success. The severity and likelihood of any adverse effects depends on the specific pollutant and its measured concentration.</p> <p>Lunar: Excessive pollutant levels (including microbial contaminants) can jeopardize crew health and/or impair mission success. The severity and likelihood of any adverse effects depends on the specific pollutant and its measured concentration.</p> <p>Mars: Excessive pollutant levels (including microbial contaminants) can jeopardize crew health and/or impair mission success. The severity and likelihood of any adverse effects depends on the specific pollutant and its measured concentration.</p>

Risk Title: Immunodeficiency / Infection

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Immunology, Infection & Hematology
Risk Number :	8
Risk Description :	It is possible that space flight may suppress immune function, a newly designated form of secondary immunodeficiency disease. Secondary immunodeficiency causes an unusual number of infections, with greater severity and duration. Secondary immunodeficiency leads to reactivation of latent virus infections with organisms that lay dormant until immune resistance is lowered and virus replication begins.
Context/Risk Factors :	Extreme environments ; Microbial contamination ; Microgravity isolation ; Nutritional deprivation ; Radiation ; Sleep deprivation ; Stress
RYG Risk Assessment :	<p>ISS: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Lunar: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p>
Justification :	<p>ISS: The contributing risk factors of space flight collectively have a powerful effect upon the cells of the immune system: T cells, particularly CD4+ (helper) T cells, B cells, NK cells, monocyte/macrophages/dendritic cells and hematopoietic stem cells. Every component of immune resistance to infection is compromised under space flight conditions, particularly the ability of the central immune cell, the CD4+ T cell.</p> <p>Lunar: The experience of the lunar surface would create the same general risks as those of the ISS. The effects of microgravity would be slightly reduced and radiation would be greater than that on the ISS. The relatively short time of the lunar mission (10-44 days) would tend to reduce the risk of developing immunodeficiency and infection.</p> <p>Mars: The long-term exposure (>1 year) to deep-space radiation and prolonged exposure to microgravity (> 2 years), length of separation from humans, constant sleep deprivation and other conditions of space flight would offer the greatest challenge to the host immune system in protecting space travelers from the development of secondary immuno-deficiency and reactivated latent viral infections.</p>
Current Countermeasures :	<p>ISS : Anti-viral agents ; Air and water monitoring ; Onboard antibiotics ; Pre-flight Quarantine (Health Stabilization Program) ; Replacement intravenous immunoglobulins ; Routine immunizations ; Use of clean vehicles</p> <p>Lunar : Anti-viral agents ; Air and water monitoring ; Onboard antibiotics ; Pre-flight Quarantine (Health Stabilization Program) ; Replacement intravenous immunoglobulins ; Routine immunizations ; Use of clean vehicles</p> <p>Because of the shorter duration of the lunar mission, the use of these countermeasures may be minimal.</p> <p>Mars :</p>

	<p>Anti-viral agents ; Air and water monitoring ; Onboard antibiotics ; Pre-flight Quarantine (Health Stabilization Program) ; Replacement intravenous immunoglobulins ; Routine immunizations ; Use of clean vehicles</p> <p>The Martian mission would be expected to produce the greatest need for these countermeasures, particularly monoclonal antibodies to pathogens and even autologous bone marrow stem cell transplants (technology to preserve these bone marrow stem cells in-flight for up to 3 years would need to be developed).</p>														
<p>Projected Countermeasures :</p>	<p>ISS : Detection systems for assessment of immune function ; Molecular detection systems for water and airborne pathogens ; Monoclonal antibodies to viral, bacterial and fungal pathogens and inflammatory mediators, such as TNF-; cytokines such as IFN- and bone marrow stem cells ; Pathogen-specific immunizations ; Anti-viral agents</p> <p>Lunar : Detection systems for assessment of immune function ; Molecular detection systems for water and airborne pathogens ; Monoclonal antibodies to viral, bacterial and fungal pathogens and inflammatory mediators, such as TNF-; cytokines such as IFN- and bone marrow stem cells ; Pathogen-specific immunizations ; Anti-viral agents</p> <p>Because of the shorter time exposure to space conditions on a lunar mission, the use of treatment countermeasures would be less.</p> <p>Mars : Detection systems for assessment of immune function ; Molecular detection systems for water and airborne pathogens ; Monoclonal antibodies to viral, bacterial and fungal pathogens and inflammatory mediators, such as TNF-; cytokines such as IFN- and bone marrow stem cells ; Pathogen-specific immunizations ; Anti-viral agents</p> <p>The long-duration and difficult living conditions of a Martian mission would stress the ability of countermeasures to remain effective (e.g., the development of bacteria, fungi, or viruses that are resistant to the anti-microbial agents brought on-board).</p>														
<p>Enabling Questions [With Mission Priority]:</p>	<table border="1"> <thead> <tr> <th data-bbox="440 936 548 978">No.</th> <th data-bbox="548 936 1505 978">Question</th> </tr> </thead> <tbody> <tr> <td data-bbox="440 978 548 1100">8a</td> <td data-bbox="548 978 1505 1100">What are the molecular and cellular mechanisms of innate and acquired immunity that become compromised with space flight conditions of radiation, microgravity, isolation, stress, microbial contamination, sleep deprivation, extreme environments and nutritional deficiency? Risk Title: Virus-Induced Lymphomas and Leukemia's

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Immunology, Infection & Hematology
Risk Number :	9
Risk Description :	This risk occurs in humans who are immunosuppressed and develop latent virus reactivation. Since the astronauts all carry many latent viruses in their bodies because of universal exposure, it is possible that if their immune resistance is lowered to a critical level, they may be subject to B-cell lymphomas and T-cell leukemias.
Context/Risk Factors :	Host genetics ; Immunodeficiency due to space flight conditions ; Latent virus reactivation
RYG Risk Assessment :	<p>ISS: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Lunar: ■ Green Health and performance consequences are known or suspected, but will not affect mission success</p>

	<p>due to effective mitigation strategies that have been validated in space.</p> <p>Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p>						
Justification :	<p>ISS: Due to severe immunosuppression caused by several space flight conditions (radiation, microgravity, isolation, stress, microbial contamination, sleep deprivation, extreme environments, nutritional deprivation), latent viruses (e.g., Epstein-Barr virus, polyomaviruses) become active and favor the selection of escape mutant lymphoid cells, which lack replication controls. These clones of lymphoid cells become oligoclonal and finally monoclonal and grow without inhibition. The nests of these clones grow into tumors that disrupt normal tissue and architecture, sap the energy of normal cells and kill the host in a short period of time.</p> <p>Lunar: The relatively short exposure of astronauts to space flight conditions in the lunar mission may not yield the final development of malignancy. However, Alan Shepard, the fifth man to step on the moon (and one of 12 to do so) surface died of T-cell leukemia. It is possible that the premalignancy is triggered in the appropriate genetic host years before oncogenic transformation occurs. Publication of the long-term health consequences of NASA's space pioneers will prove an important source of clinical evidence.</p> <p>Mars: The length and severity of space flight conditions of the Martian Mission are expected to pose the most dangerous risk for the development of immune cell-mediated leukemias and lymphomas. Animal model studies are the only means, at present, by which to assess the risk of virus-induced tumors in an immunosuppressed host.</p>						
Current Countermeasures :	<p>ISS : Cytotoxic anti-EBV T cells ; Monitor exposure to radiation and other environmental factors ; Monoclonal anti-B cell (tumor) antibody (Rituximab) ; Ongoing health status monitoring ; Radiation shielding</p> <p>Lunar : Cytotoxic anti-EBV T cells ; Monitor exposure to radiation and other environmental factors ; Monoclonal anti-B cell (tumor) antibody (Rituximab) ; Ongoing health status monitoring ; Radiation shielding</p> <p>Use of countermeasures may not be needed on short voyages to the Moon, but in later years if tumors develop.</p> <p>Mars : Cytotoxic anti-EBV T cells ; Monitor exposure to radiation and other environmental factors ; Monoclonal anti-B cell (tumor) antibody (Rituximab) ; Ongoing health status monitoring ; Radiation shielding</p> <p>Need to develop radiation-proof container for autologous stem cell transplants. The other countermeasures can be delivered in deep-space.</p>						
Projected Countermeasures :	<p>ISS : Autologous stem cell transplants ; Fusion proteins to block virus reinfection ; Specific antiviral drugs</p> <p>Lunar : Autologous stem cell transplants ; Fusion proteins to block virus reinfection ; Specific antiviral drugs</p> <p>Use of monoclonal anti-B cell tumor antibodies and cytotoxic anti-EBV T cells may not be necessary on the short Moon mission, but they may be necessary after return to Earth.</p> <p>Mars : Autologous stem cell transplants ; Fusion proteins to block virus reinfection ; Specific antiviral drugs</p> <p>Technology needs to be developed to preserve autologous cytotoxic anti-EBV T cells on board the spacecraft in the Martian mission. The other countermeasures could presently be delivered in deep-space.</p>

Risk Title: Anemia, Blood Replacement & Marrow Failure

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Immunology, Infection & Hematology
Risk Number :	10
Risk Description :	There is loss of plasma and red blood cells due to exposure to microgravity and a there is a decrease of RBCM of 15% in the first week in space (2 units of blood). This can lead to problems with spaceflight anemia, or hemorrhage.
Context/Risk Factors :	Age ; Baseline ; Decreased production ; Gender ; Marrow stores ; Need during surgery ; Nutrition ; Trauma – loss & destruction
RYG Risk Assessment :	<p>ISS: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Lunar: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p>
Justification :	<p>ISS: TBD</p> <p>Lunar: TBD</p> <p>Mars: TBD</p>
Current Countermeasures :	<p>ISS : Blood replacement ; Hormonal & stem cell therapy ; Nutrition ; Pharmaceutical</p> <p>Lunar : Blood replacement ; Hormonal & stem cell therapy ; Nutrition ; Pharmaceutical</p> <p>Mars : Blood replacement ; Hormonal & stem cell therapy ; Nutrition ; Pharmaceutical</p>
Projected	ISS :

Countermeasures :	TBD Lunar : TBD Mars : TBD	
Enabling Questions [With Mission Priority]:	No.	Question
	10a	What are the methods for space based therapy for blood replacement? What new technologies are needed for blood replacement in space? [ISS 3, Lunar 2, Mars 1]
	10b	What are the nutritional requirements for adequate red cell production in microgravity? What are the contributory factors and how do they inter-relate in the development of space anemia (radiation, unloading, nutrition, fluid shift, changes in sex hormones, etc.)? [ISS 2, Lunar 2, Mars 2]
	10c	How can aplastic anemia be treated during space missions? [ISS 5, Lunar 5, Mars 3]
Related Risks :

Risk Title: Altered Host-Microbial Interactions

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Immunology, Infection & Hematology
Risk Number :	11
Risk Description :	The balance between human host and microbes found on Earth may be altered in space because of responses associated with microgravity, stress, radiation, or other space flight factors.
Context/Risk Factors :	Extreme environments ; Isolation ; Microbial contamination ; Microgravity ; Nutritional deprivation ; Radiation ; Sleep deprivation ; Stress
RYG Risk Assessment :	<p>ISS: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Lunar: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p>
Justification :	<p>ISS: Changes in microflora; novel microbial ecosystems; genetic changes/mutations of microorganisms; alterations in host microbe interaction; alterations in host susceptibility.</p> <p>Lunar: The short-duration of the lunar mission might not provide sufficient time for significant alterations in the host: microbe relationship.</p> <p>Mars: The long-duration and severe nature of space flight conditions on a Mars mission would favor the alterations in the host: microbe relationship. Possibly, evolution of a supermicrobe that overpowers the human immune response would be favored.</p>
Current Countermeasures :	<p>ISS : In-flight environmental monitoring and bioburden reduction procedures</p> <p>Lunar : In-flight environmental monitoring and bioburden reduction procedures</p> <p>Mars : In-flight environmental monitoring and bioburden reduction procedures</p>
Projected Countermeasures :	<p>ISS : Comprehensive microbial identification technology based on mass spectrometry and/or hybridization ; In-flight antibiotic susceptibility testing capability ; Pre-flight screening ; Routine In-flight microbial identification/monitoring capability</p> <p>Lunar : Comprehensive microbial identification technology based on mass spectrometry and/or hybridization</p>

	<p>; In-flight antibiotic susceptibility testing capability ; Pre-flight screening ; Routine In-flight microbial identification/monitoring capability</p> <p>Mars : Comprehensive microbial identification technology based on mass spectrometry and/or hybridization ; In-flight antibiotic susceptibility testing capability ; Pre-flight screening ; Routine In-flight microbial identification/monitoring capability</p>

Risk Title: Allergies and Autoimmune Diseases

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Immunology, Infection & Hematology
Risk Number :	12
Risk Description :	Genetic inheritance and environmental insults are the two factors that trigger development of allergic and autoimmune diseases. Failure of immunologic tolerance due to malfunction of regulatory immune mechanisms leads to immune-mediated diseases in life. Space flight conditions have been shown to upset immune regulation and produce immunologic disease in experimental systems.
Context/Risk Factors :	Extreme environments ; Isolation ; Microbial contamination ; Microgravity ; Nutritional deprivation ; Radiation ; Sleep deprivation ; Stress
RYG Risk Assessment :	<p>ISS: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Lunar: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p>
Justification :	<p>ISS: In contrast to immunodeficiency where a lowered immune response looks to a predilection for opportunistic infection and malignancy, a heightened immune response leads to allergic and autoimmune diseases, which are part of the spectrum of hypersensitivity reactions mediated by IgE (Type I), antibody-cell receptor interactions (Type II), immune complexes (Type III) and T-cell mediated diseases (Type IV). Central to all of these paradoxical over-reactions of the immune system is the immunoregulatory T cell (CD4+DC25+)" Space flight conditions have the potential to affect this cell and other immunoregulatory cells that networks to produce all of our types of hypersensitivity: Allergy (Type I) and Autoimmune Diseases (Types II, III, IV).</p> <p>Lunar: Although the lunar mission is short in duration, there may be sufficient loss of fine control of immune tolerance to produce immune diseases later in life.</p> <p>Mars: It is very likely that severe allergies and autoimmune diseases will result from a Martian mission, unless specific counter-measures are developed. The length and severity human exposure to</p>

	environmental insults will most likely result in allergic and immunologic diseases.														
Current Countermeasures :	<p>ISS : Toxicological/Environmental/Microbiological standards for spacecraft atmosphere</p> <p>Lunar : Toxicological/Environmental/Microbiological standards for spacecraft atmosphere</p> <p>Use of these countermeasures may not be needed in the lunar mission but may be needed later in life.</p> <p>Mars : Toxicological/Environmental/Microbiological standards for spacecraft atmosphere</p> <p>These countermeasures must be ready for use in a Mars mission.</p>														
Projected Countermeasures :	<p>ISS : Antigen peptide immunotherapy ; Dendritic cell-antigen vaccines ; Monoclonal anti-IgE antibody ; Monoclonal antibody to CD52+ cells, TNF-, C3+ T cells, CD19+/20+ B cells; soluble receptors (7) for TNF-, IL-1, IL-2 ; Th1 immunostimulants (e.g., CpG)</p> <p>Lunar : Antigen peptide immunotherapy ; Dendritic cell-antigen vaccines ; Monoclonal anti-IgE antibody ; Monoclonal antibody to CD52+ cells, TNF-, C3+ T cells, CD19+/20+ B cells; soluble receptors (7) for TNF-, IL-1, IL-2 ; Th1 immunostimulants (e.g., CpG)</p> <p>Mars : Antigen peptide immunotherapy ; Dendritic cell-antigen vaccines ; Monoclonal anti-IgE antibody ; Monoclonal antibody to CD52+ cells, TNF-, C3+ T cells, CD19+/20+ B cells; soluble receptors (7) for TNF-, IL-1, IL-2 ; Th1 immunostimulants (e.g., CpG)</p>

Risk Title: Skeletal Muscle Atrophy Resulting in Reduced Strength and Endurance

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Muscle Alterations & Atrophy
Risk Number :	13
Risk Description :	Given that deficits in sensory-motor regulation of muscle-force generation capacity and movement skill occur in space flight, this deficiency could result in an inability or reduced ability/fidelity in performing mission-directed physical activities (especially when the system becomes loaded), as well

	as cause a proneness for muscle/connective tissue (muscle fiber; fiber-tendon; tendon-bone interfaces) damage and soreness, further exacerbating intrinsic muscle performance capacity.														
Context/Risk Factors :	Muscle atrophy is the result of sarcopenia or net protein catabolism associated with skeletal muscle unloading and this alteration likely increases compliance of the muscle vascular bed which could impair venous return (i.e., muscle pump) and contribute to orthostatic intolerance upon re-exposure to a gravitational environment and accelerate bone loss due to reductions in muscle tone and the force generating capacity of the muscle and the corresponding reduction of force at the tendon/bone interface														
RYG Risk Assessment :	<p>ISS: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Lunar: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p>														
Justification :	<p>ISS: Growing database demonstrating that skeletal muscles, particularly postural muscles of the lower limb, undergo atrophy and undergo structural and metabolic alterations during space flight.</p> <p>Lunar: Growing database demonstrating that skeletal muscles, particularly postural muscles of the lower limb, undergo atrophy and undergo structural and metabolic alterations during space flight.</p> <p>Mars: Growing database demonstrating that skeletal muscles, particularly postural muscles of the lower limb, undergo atrophy and undergo structural and metabolic alterations during space flight.</p>														
Current Countermeasures :	<p>ISS : Cycle ergometer ; Moderate resistance exercise ; Treadmill</p> <p>Lunar : Cycle ergometer ; Moderate resistance exercise ; Treadmill</p> <p>Mars : Cycle ergometer ; Moderate resistance exercise ; Treadmill</p>														
Projected Countermeasures :	<p>ISS : Artificial gravity (e.g., centrifuge with exercise capabilities) ; New programs of heavy resistance exercise (e.g., expanded exercise and loading capabilities) ; Pharmacological interventions</p> <p>Lunar : Artificial gravity (e.g., centrifuge with exercise capabilities) ; New programs of heavy resistance exercise (e.g., expanded exercise and loading capabilities) ; Pharmacological interventions</p> <p>Mars : Artificial gravity (e.g., centrifuge with exercise capabilities) ; New programs of heavy resistance exercise (e.g., expanded exercise and loading capabilities) ; Pharmacological interventions</p>

[ISS 3, Lunar 3, Mars 3]
No.	Question														
13a	What is the time course of skeletal muscle atrophy during an ISS, lunar, and Mars mission? [ISS 1, Lunar 1, Mars 1]														
13b	Does muscle atrophy of the lower extremity muscles contribute to orthostatic hypotension due to deficiencies in the muscle pump? [ISS 1, Lunar 1, Mars 1]														
13c	Does skeletal muscle atrophy contribute to the accelerated rate of bone loss in the central and peripheral skeleton because of reduced forces at the tendon insertion sites during long-duration space missions? [ISS 1, Lunar 1, Mars 1]														
13d	What hardware and/or technologies are currently available, or need to be developed for an ISS, lunar, or Mars mission in order to simulate the type of musculoskeletal loading experienced here on Earth to preserve muscle structure and function? [ISS 3, Lunar 3, Mars 3]														
13e	What are the effects of skeletal muscle atrophy on whole body metabolism (e.g., insulin and glucose tolerance)? [ISS 1, Lunar 3, Mars 1]														
13f	Are the deleterious changes that occur in skeletal muscle (atrophy, alterations in contractile phenotype, etc.) during long-duration space flight missions completely reversible upon return to Earth? [ISS 3, Lunar 3, Mars 3]														

13g	What combination of exercise and/or hormonal/pharmacological, nutritional and micronutrient supplements are effective in preserving muscle structure and function during ISS, lunar, and Mars missions? [ISS 1, Lunar 1, Mars 1]
13h	What are the appropriate prescription modalities (exercise regimens, artificial gravity, etc.) and the compliance factors needed during an ISS, lunar, and Mars mission to minimize losses in muscle mass and strength? [ISS 1, Lunar 1, Mars 1]
13i	What are the effective resistance exercise modalities (contraction modes) and exercise prescriptions (frequency, intensity, duration) needed to maintain skeletal muscle structure and function during an ISS, lunar, and Mars mission? [ISS 1, Lunar 1, Mars 1]
13j	What are the appropriate prescription modalities (exercise regimens, physical therapy, etc.) and the compliance factors needed to facilitate skeletal muscle rehabilitation in crewmembers returning from microgravity, 1/3-gravity, or 1/6-gravity to Earth gravity? [ISS 1, Lunar 1, Mars 1]
13k	What cellular processes/signaling pathways in skeletal muscle can be identified and targeted (pharmacological, gene therapy, hormones, etc.) to prevent or attenuate fiber atrophy during ISS, lunar, or Mars missions? [ISS 3, Lunar 3, Mars 3]
13l	What practical diagnostic tools (e.g., biochemical markers, ultrasound) can be used during ISS, lunar, and Mars missions to monitor and quantify changes in muscle structure and function? [ISS 3, Lunar 3, Mars 3]
13m	Is the capacity of skeletal muscle to grow or regenerate (satellite cells) compromised during or after a mission because of conditions (e.g., radiation exposure, reduced muscle tension) associated with an ISS, lunar, and Mars mission? [ISS 3, Lunar 2, Mars 1]
13n	What are the temporal relationships between the changes in structure and function of the tendon, muscle and muscle-tendon interface? [ISS 2, Lunar 2, Mars 2]
13o	How do the deficits in skeletal muscle strength associated with long-duration space flight affect the structural/functional properties of the sensory system and motor nerves? [ISS 1, Lunar 1, Mars 1]
13p	Can those resistance exercise paradigms and other activity modalities aimed at counteracting atrophy processes maintain those deficits in muscle strength that appear to occur independent of the atrophy process? [ISS 1, Lunar 1, Mars 1]
13q	What are the bioenergetic, metabolic and substrate-processing factors that contribute to the reductions in skeletal muscle endurance associated with muscle atrophy? [ISS 1, Lunar 1, Mars 1]
13r	Can endurance exercise activities that normally enhance skeletal muscle endurance under weight bearing conditions effectively maintain this property in atrophying muscle when they are performed in microgravity environments? [ISS 2, Lunar 2, Mars 2]
13s	How does the atrophy process affect the structural and functional properties of connective tissue (tendons), the fiber-tendon interface and the tendon-bone interface? [ISS 2, Lunar 2, Mars 2]
13t	Do resistance-training paradigms that counteract muscle atrophy processes improve the structure-function properties of connective tissue systems? (countermeasure) [ISS 2, Lunar 2, Mars 2]
13u	Do strength-training programs that minimize atrophy processes and strengthen muscle tendon properties that are performed in states of unloading prevent injury from occurring during the return to normal weight bearing states? [ISS 1, Lunar 1, Mars 1]
13v	What are the appropriate prescription modalities (exercise regimens, physical therapy, etc.) and the compliance factors needed to facilitate skeletal muscle rehabilitation in crewmembers returning from the ISS, Moon, or Mars to Earth gravity? [ISS 1, Lunar 1, Mars 1]
13w	What combination of exercise and/or hormonal/pharmacological, nutritional and micronutrient supplements are effective in preserving muscle structure and function during missions to the ISS, Moon, and Mars? [ISS 2, Lunar 2, Mars 2]

Risk Title: Increased Susceptibility to Muscle Damage

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Muscle Alterations & Atrophy
Risk Number :	14
Risk Description :	Given that muscle fiber atrophy and corresponding contractile protein phenotype shifts occur in response to space flight, this deficiency could result in an inability or reduced ability/fidelity in performing mission-directed physical activities, as well as cause a proneness for muscle/connective tissue damage and soreness further exacerbating one's performance.
Context/Risk Factors :	Given the reductions in skeletal muscle size, strength and endurance that result from space flight exposure, there is a greater likelihood of sustaining muscle and/or connective tissue damage and soreness that could result in an inability or reduced ability/fidelity in performing mission-directed physical activities
RYG Risk Assessment :	<p>ISS: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Lunar: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p>
Justification :	<p>ISS: Growing database based on space flight and ground based studies demonstrating that muscle atrophy processes are associated with changes in structural proteins and connective tissues, which could impair performance of various activities during and after ISS, lunar, or Mars missions.</p> <p>Lunar: Growing database based on space flight and ground based studies demonstrating that muscle atrophy processes are associated with changes in structural proteins and connective tissues, which could impair performance of various activities during and after ISS, lunar, or Mars missions.</p> <p>Mars: Growing database based on space flight and ground based studies demonstrating that muscle atrophy processes are associated with changes in structural proteins and connective tissues, which could impair performance of various activities during and after ISS, lunar, or Mars missions.</p>
Current Countermeasures :	<p>ISS : Cycle ergometer ; Moderate resistance exercise ; Treadmill</p> <p>Lunar : Cycle ergometer ; Moderate resistance exercise ; Treadmill</p> <p>Mars : Cycle ergometer ; Moderate resistance exercise ; Treadmill</p>
Projected Countermeasures :	<p>ISS : Artificial gravity (e.g., centrifuge with exercise capabilities) ; New programs of heavy resistance exercise (e.g., expanded exercise and loading capabilities) ; Pharmacological interventions</p> <p>Lunar : Artificial gravity (e.g., centrifuge with exercise capabilities) ; New programs of heavy resistance exercise (e.g., expanded exercise and loading capabilities) ; Pharmacological interventions</p> <p>Mars : Artificial gravity (e.g., centrifuge with exercise capabilities) ; New programs of heavy resistance exercise (e.g., expanded exercise and loading capabilities) ; Pharmacological interventions</p>

Enabling Questions [With Mission Priority]:	No.	Question
	14a	If a muscle injury occurs during an ISS, lunar or Mars mission, what criteria can be used to determine when it is safe for a crewmember to resume exercise or perform dynamic activities associated with the mission (e.g., EVA/exploration)? [ISS 1, Lunar 1, Mars 1]
	14b	Do strength-training programs that minimize atrophy processes and strengthen muscle tendon properties that are performed in states of unloading prevent injury from occurring during a mission and upon return to weight bearing states (e.g., 1-G)? [ISS 1, Lunar 1, Mars 1]
	14c	Do resistance-training paradigms that counteract muscle atrophy processes improve the structure-function properties of connective tissue systems? [ISS 2, Lunar 2, Mars 2]
	14d	How does the atrophy processes affect the structural and functional properties of connective tissue (tendons), the fiber-tendon interface and the tendon-bone interface? [ISS 3, Lunar 3, Mars 3]
	14e	Are the deleterious changes that occur in skeletal muscle (atrophy, alterations in contractile phenotype, etc.) during long-duration space flight missions completely reversible upon return to Earth? [ISS 3, Lunar 3, Mars 3]
	14f	Do the deficits in skeletal muscle associated with long-duration space flight affect the structural/functional properties of the sensory system and motor nerves (e.g., motor unit recruitment strategies within a muscle, altered muscle recruitment strategies for a given joint)? [ISS 1, Lunar 1, Mars 1]
	14g	What are the appropriate ground-based space flight analog environments that can be used as test beds for evaluating neurological adaptation time constants, adverse operational implications, countermeasures and impacts of adaptation on other anatomical and physiological systems? [ISS 1, Lunar 1, Mars 1]

Risk Title: Vertigo, Spatial Disorientation and Perceptual Illusions

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Neurovestibular Adaptation

Risk Number :	15
Risk Description :	When astronauts transition between gravitational environments, head movements and/or vehicle maneuvering can cause spatial disorientation, perceptual illusions and/or vertigo. Should any of these occur in flight deck crewmembers during critical entry or landing phases it could lead to loss of vehicle. In-flight spatial disorientation can cause operational difficulties during docking and remote manipulation of payloads that can (and has) caused dangerous collisions, while in-flight frame-of-reference illusions, direction vertigo, or navigation problems could cause reaching errors, spatial memory failures, difficulty locating emergency egress routes and/or fear of falling during EVA (height vertigo). While rotational artificial gravity (AG) has great potential as a bone, muscle, cardiovascular and vestibular countermeasure, head movements out of the plane of rotation will produce illusory spinning sensations about an axis orthogonal to the head motion, which may lead to spatial disorientation.
Context/Risk Factors :	Landing 0-G exposure duration. (Vertigo is an aftereffect of neurovestibular adaptation to 0-G, which may require several weeks.) ; Manual or supervisory control of vehicle by crewmember during critical phase of flight ; Non-zero gravitational level ; Pilot head movements, especially large or rapid ones. (Head movement contingent vertigo reported in early phases of entry. Orbiter crews routinely make slow practice head movements during entry to initiate re-adaptation) ; Poor visual reference to runway environment. (e.g., approaches at night or with low ceilings or poor visibility or to unfamiliar runway) ; Turbulence or wind shear in approach area ; Vehicle maneuvers (e.g. deceleration on inner glide slope; flare) In-Flight Teleoperations requiring user to cognitively integrate several different views of a work area, or transform commands to a different reference frame ; Physical orientation of 1-G training modules ; Ambiguous visual orientation cues (interior architectural symmetries, rack orientation and labeling, EVA visual cues) ; Inconsistent visual verticals (within and between modules) ; Individual ability differences (mental rotation, perspective taking, and sense of direction)
RYG Risk Assessment :	ISS: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space. Lunar: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space. Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.
Justification :	ISS: Problem has been with us throughout Shuttle program (e.g. perhaps as early as STS-3), and became recognized after multi-week shuttle missions in late 90s (cf. McCluskey, et al 2001). Currently constrains time on orbit of shuttle pilots, and night and low visibility approaches. Shuttle auto-land capability has not been operationally verified, and contingency landing sites do not have required microwave landing system. Skylab and Shuttle crews described almost universal incidence of occasional in-flight spatial disorientation and frame-of-reference illusions. Mir and ISS crews report susceptibility continues throughout long missions, and are exacerbated by complex 3D station architectures, inconsistent interior visual verticals, and perhaps by physical orientation of their ground trainers. Shuttle crews visiting Mir and ISS occasionally became lost, a concern in case emergency egress was required. EVA crewmembers occasionally report disorientation and disabling fear of falling to Earth. Reference frame integration problems have been noted by Shuttle and ISS teleoperators, and contributed to Mir-Progress collision, and complicated several other emergencies NASA Man System Integration Standard 3000 required locally consistent cue orientation and lighting, but did not address consistency between modules or work areas. However ISS (SSP5005) deleted many MSIS requirements. ISS modules have symmetric cross section and dual visual verticals. Lunar: Some degree of manual control and maneuvering will be required for landing at unprepared lunar landing sites. Effects on crew capability of 7 day 0-G transits and 30 day adaptation to lunar 1/6 g, and are currently unknown. Apollo mission durations were less than 15 days. Crews' 1/6 g exposure on lunar surface was limited to 75 hours. No vertigo reported during lunar landing or EVA. Lunar Module did not have auto-land. Command module auto-landed in Earth's ocean. Significant exposure to this risk in 0-G areas of Lunar transit vehicles and 0-G EVA. Teleoperator frame of reference integration problems potentially a factor in Lunar surface operations. Mars: Even if Earth and Mars landings are nominally auto-landed, some degree of maneuvering and contingency manual control will be needed for landing at unprepared or contingency sites. Effects of 4-6 month adaptation to 0-G during transit to Mars on astronaut's ability to transition to Mars 1/3 g are unknown. However, large radius continuous AG may be possible. On return to Earth, pilot will

	have adapted to 0-G for 4-6 months, and ISS experience indicates many will experience strong landing vertigo. Significant exposure to this risk in 0-G areas of Mars transit vehicles and 0-G EVAs. Teleoperator frame of reference integration problems potentially a factor in Mars surface operations																		
Current Countermeasures :	<p>ISS : Landing CDRs are space flight veterans. CDR flies approach, PLT assists. Previous flight experience may help pilots cope with vertigo ; Re-adaptation head movements during entry. No formal procedure exists. Efficacy is unknown ; Restrictions on night and low ceiling/visibility approaches. Visual approach aids and runway lighting ; Shuttle pilot's 0-G exposure currently limited to 2-3 weeks In-Flight Luminous exit placards, and module surface labels ; Pre-flight EVA training using virtual reality techniques ; Pre-flight training in 1-G modules and neutral buoyancy Lunar : None Mars : None</p>																		
Projected Countermeasures :	<p>ISS : Landing Implement shuttle auto-land capability at landing sites ; Correlate shuttle approach flight technical error, vehicle accelerations, head movements, display legibility, post-flight visual acuity, gaze stability, OTTR, and G-excess illusions ; Determine efficacy of re-adaptation head movements during entry ; Evaluate landing vertigo effect on pilots supervisory control capability. ; Evaluate pre-flight or in-flight neurovestibular g-context-specific pre-adaptation techniques (e.g. short radius artificial gravity) and in-flight landing rehearsal simulators. ; Improved standards for workstation and spacecraft interior architecture ; Improved teleoperator displays ; Quantitative metrics for visual symmetry and polarity cues ; Redesign cockpit procedures and displays (e.g. flight director) to minimize head movements and accelerations, and to improve legibility during vertigo ; Validated spatial ability tests to predict and improve individual performance ; Pre-flight visual orientation training for IVA activities using VR techniques[CRL 2-5] Lunar : Landing Auto-land capability on lunar or Mars landing and return vehicles ; Pre-flight or in-flight g-specific pre-adaptation techniques, (e.g. artificial gravity) Mars : Landing Auto-land capability on lunar or Mars landing and return vehicles ; Pre-flight or in-flight g-specific pre-adaptation techniques, (e.g. artificial gravity)</p>

Risk Title: Impaired Movement Coordination Following G-Transitions

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Neurovestibular Adaptation
Risk Number :	16
Risk Description :	When astronauts adapt to 0-G transition to an Earth, Moon, or Martian gravitational environment, balance, locomotion and eye-head coordination are transiently disrupted. Some symptoms may be masked by sensory substitution, only to emerge unexpectedly in response to changing sensory affordance contexts. Muscle atrophy and orthostatic hypotension may also contribute to post-flight balance and locomotion impairment. Some long-duration crewmembers have been unable to egress the spacecraft unassisted in 1-G, so affected crew are at an increased risk of emergency at or soon after landing. There are large individual differences, but recovery of normal abilities requires several days to weeks. Recovery time increases as the 0-G exposure time increases. Lower extremity coordination is often the slowest to return. Post-flight rehabilitation currently employs only traditional methods and may not be optimal. Sensory-motor changes on long-duration flights increases the potential risk of post-landing falls and bone fractures and delays safe return to normal daily activities (running, driving and flying).
Context/Risk Factors :	Cardio-regulatory changes or reduced blood volume increasing susceptibility to fainting ; Muscle alterations and atrophy due to lack of appropriate 0-G exercise ; Physical activity leading to head movement, or requiring visual acuity (e.g. running, operation of a vehicle or aircraft) ; The longer a crewmember is exposed to 0-G, generally the more profound and long lasting the post-flight symptoms ; Zero-g exposure duration
RYG Risk Assessment :	<p>ISS: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Lunar: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p>
Justification :	<p>ISS: Shuttle post-landing emergency egress requires crew to stand up, operate a hatch, attach and lower themselves on a tether, and run away from the vehicle. Cardiovascular and musculo-skeletal countermeasures have mitigated the incidence of muscle weakness, fatigue, and fainting, but many returning crews still exhibit clinically and operationally significant post-flight neurovestibular signs. Long duration crews currently undergo a post-flight physical rehabilitation program based on traditional techniques. Flight surgeons have taken a conservative clinical approach, and no NASA crewmembers have had post-flight fractures or auto accidents. However, none have been able to run 1000 feet on a treadmill on landing day. Animal experiments indicate the vestibular system may play a role in cardiovascular orthostatic regulation.</p> <p>Lunar: Apollo EVA crews adopted a loping gait in the 1/6 g lunar environment. No reported vertigo and coordination problems. Fracture risks in 1/6 g likely minimal. Primary risks are after return to Earth after long duration (44 day) missions.</p> <p>Mars: Mars landings may be in unprepared areas, so posture and locomotion ability in 1/3 g immediately after landing is potentially important in emergencies. Fracture risk in 1/3 g not yet determined, and will depend on countermeasures available in transit vehicle. Mars transit vehicles may use</p>

	intermittent or continuous AG to pre-adapt crews for Mars surface operations, and to prepare crews for return to Earth.																												
Current Countermeasures :	<p>ISS : Quantitative post-flight tests of spontaneous, positional and positioning nystagmus, postural stability, dynamic visual acuity, and gait (TRL/CRL8) ; Traditional clinical rehabilitation techniques</p> <p>Lunar : None</p> <p>Mars : None</p>																												
Projected Countermeasures :	<p>ISS : General or G-specific pre-adaptation techniques, (e.g. in-flight or pre-flight artificial gravity; sensory-motor generalization training techniques ; 1-G balance prostheses (e.g. tactile vest, TRL/CRL6) ; Quantitative post-flight tests of gaze stability, and locomotion and corner turning stability (TRL 6, CRL 6)</p> <p>Lunar : Pre-flight or in-flight g- specific pre-adaptation techniques, (e.g. artificial gravity) (CRL2, TRL1)</p> <p>Mars : Improved EVA suits designed to mechanically mitigate fracture risk in the event of falls ; G-specific pre-adaptation for Mars landing (e.g. short radius intermittent or large radius continuous artificial gravity) and return to Earth</p>

Risk Title: Motion Sickness

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Neurovestibular Adaptation
Risk Number :	17
Risk Description :	<p>Motion sickness symptoms frequently occur in crewmembers during and after G-transitions. Symptoms include nausea, stomach awareness, gastrointestinal stasis, anorexia, dehydration and less overt but operationally significant symptoms such as "space stupids," irritability, profound fatigue ("sopite" syndrome) and changes in sleep-wake cycle. Motion sickness symptoms decrease crew work capacity, vigilance and motivation, impair short-term memory and increase the likelihood of cognitive error. Although only 10-20% of Shuttle crews vomit, 75% experience symptoms for the first 2-4 days in 0-G and many experience similar symptoms for hours to days after landing. Several crewmembers have remained symptomatic during flight for up to two weeks. Current anti-motion sickness drugs are only partially effective. Though they appear to reduce symptoms and delay onset, they have significant side effects that prevent regular prophylactic use. While rotational AG has great potential as a bone, muscle, cardiovascular and vestibular countermeasure, head movements out of the plane of rotation may lead to motion sickness. How provocative the AG stimulus is at levels between 0 and 1-G and how rapidly and completely humans can adapt is largely unknown and cannot be fully determined in ground laboratories. If motion sickness drives an EVA crewmember to vomit in the extant extravehicular mobility unit (EMU), a complete shutdown of the primary and secondary oxygen supplies could occur, leaving only a few minutes of residual oxygen in the suit, creating a serious emergency. Vomit on the faceplate could also block vision. Even if the crewmember survives, vomit is biologically active, so the EMU cannot be reused and must be returned to the ground for refurbishment.</p>
Context/Risk Factors :	Initial week of exposure to altered gravity ; Head movements and visual cues causing frame-of-reference illusions ; Diseases, conditions or drugs which cause nausea and vomiting (gastroenteritis, contaminated food or water, certain medications, pregnancy)
RYG Risk Assessment :	<p>ISS: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Lunar: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Mars: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p>
Justification :	<p>ISS: Mercury and Gemini crews were restrained in their capsules, and did not report sickness. Primary stimuli are clearly head movements and frame-of-reference illusions resulting from 3D movement. Crews move slowly and stay upright to limit symptoms. Prior space flight experience reduces susceptibility. Apollo, Skylab and early Shuttle crews took prophylactic oral scopolamine/dexedrine or promethazine/ephedrine, with limited effectiveness, and sometimes objectionable side-effects. Symptoms are currently treated with intramuscular promethazine and sleep/rest, but injections leave a painful sore spot. Early US and Russian programs implemented aerobic flight and various forms</p>

	<p>of extreme vestibular stimulation as pre-flight countermeasures, and use of Coriolis induced sickness susceptibility as a predictor, without demonstrable success, though many crew believe aerobatic and parabolic flight practice should be helpful. NASA developed TransdermScop patch in early 80s, but effectiveness and side effects were too variable for deployment. Russians deployed neck restraints and foot-pressure-inducing boots, but there is no data showing effectiveness. Biofeedback/autogenic training techniques can be effective against laboratory induced sickness, but flight evaluations have been equivocal, and techniques may not be usable by everyone.</p> <p>Lunar: Several Apollo crews retrospectively reported symptoms in Earth orbit, and on the way to the moon. No symptoms reported on lunar surface. One report of symptoms during 0-G return.</p> <p>Mars: Crew will be potentially susceptible to motion sickness for several days after each major G-level change during the mission (1-G to 0-G to AGto 0-G to 0-G to Martian-g to 0-G to artificial-g to 0-G to Earth-g.)</p>																								
<p>Current Countermeasures :</p>	<p>ISS : Head and body movement restriction ; Intramuscular promethazine injection ; Oral Promethazine/Ephedrine ; Oral Scopolamine/Dexedrine</p> <p>Lunar : Head and body movement restriction ; Intramuscular promethazine injection ; Oral Promethazine/Ephedrine ; Oral Scopolamine/Dexedrine</p> <p>Mars : Head and body movement restriction ; Intramuscular promethazine injection ; Oral Promethazine/Ephedrine ; Oral Scopolamine/Dexedrine</p>																								
<p>Projected Countermeasures :</p>	<p>ISS : New administration methods for rapid, reliable relief with fewer side effects ; Techniques to quantify cognitive deficits</p> <p>Lunar :</p> <p>Mars : Large radius continuous or short radius intermittent AG</p>

Risk Title: Inadequate Nutritional Requirements

Theme :	Human Health and Countermeasures (HH&C)
Discipline :	Nutrition
Risk Number :	18
Risk Description :	Without scientifically supported nutritional requirements, a food system cannot be developed to support astronaut health. Nutritional requirements for space include fluids, macronutrients, micronutrients and compounds or elements that may be essential and may include compounds that may be required to optimize health status such as lipids, energy distribution (e.g., % calories from carbohydrate), fiber, and non-nutritive factors such as various phytochemicals, etc. Requirements must take into account any changes in the sensory system that might influence taste and smell influence intake, and the role of countermeasure-induced alterations on nutrient requirements.
Context/Risk Factors :	For missions where in situ food production are required, failure of this system would be an associated risk as well ; Psychosocial factors, elevated stress and boredom all contribute to this risk ; Undefined nutritional requirements causing inability to provide nutritional foods, exacerbate substandard food intakes, countermeasure-induced alterations in nutrient requirements leading to poor countermeasure performance; e.g., bone, muscle, immune system and radiation protection
RYG Risk Assessment :	<p>ISS: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Lunar: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p>
Justification :	<p>ISS: Essentially all US crews have experienced nutritional deficiencies. Limited foods, physiological</p>

	<p>changes, stress and other factors may have consequences for physical and cognitive performance. Inadequate micronutrient or vitamin intake could adversely affect crew health, making determination of all required nutrients (absorption, metabolism, excretion) a priority. Furthermore, nutrition/nutrients may play a role in counteracting the negative effects of space flight (e.g., radiation, bone and muscle loss). These have yet to be fully explored.</p> <p>Lunar: Essentially all US crews have experienced nutritional deficiencies. Risk Title: Monitoring & Prevention

Theme :	Autonomous Medical Care (AMC)
Discipline :	Clinical capabilities
Risk Number :	19
Risk Description :	Monitoring and Prevention (Health Tracking, Prophylaxis & Disease Prevention). The primary means to reduce the risk of life and/or mission-threatening medical conditions is to prevent those conditions from happening. The second most effective means to reduce such risk is to monitor for medical conditions so as to catch them at an early stage to treat.
Context/Risk Factors :	Family history ; Medical history ; Pre-flight screening ; Pre-mission screening
RYG Risk Assessment :	ISS: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space. Lunar: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space. Mars: ■ Red Unacceptable risk of serious adverse health or performance consequences; there is no mitigation strategy that has been validated in space or demonstrated on Earth.
Justification :	ISS: TBD Lunar: TBD Mars: TBD
Current Countermeasures :	ISS : Annual comprehensive physical exam ; In-flight examination ; Selection criteria for astronauts to become active and to be selected for a mission Lunar : Annual comprehensive physical exam ; In-flight examination ; Selection criteria for astronauts to become active and to be selected for a mission Mars : Annual comprehensive physical exam ; In-flight examination ; Selection criteria for astronauts to become active and to be selected for a mission
Projected Countermeasures :	ISS : Additional screening criteria ; Better equipment to monitor and track health in-flight Lunar : Additional screening criteria ; Better equipment to monitor and track health in-flight Mars : Additional screening criteria ; Better equipment to monitor and track health in-flight

Enabling Questions [With Mission Priority]:	No.	Question
	Health Tracking	
	19a	Define the key parameters for health screening and early detection. [ISS 4, Lunar 2, Mars 1]
	19b	Identify what resources and technologies are required for routine health monitoring, including examination, laboratory, imaging and adaptation for operation in reduced-G environments [ISS 4, Lunar 2, Mars 1]
	19c	What diagnostic imaging technologies and procedures need to be developed and/or adapted to support the primary, secondary and tertiary prevention of illness and injury? [ISS 3, Lunar 2, Mars 1]
	19d	Identify the parameters and sensors needed to monitor health and performance in crewmembers performing EVA [ISS 4, Lunar 2, Mars 2]
	19e	Identify the investigations needed to discriminate between terrestrial and space flight norms in order to allow early detection of illness and injury. [ISS 3, Lunar 2, Mars 2]
	19f	What is space-normal physiology? [ISS 4, Lunar 3, Mars 3]
	19g	What are the signs, symptoms or abnormal examination findings (including laboratory) associated with illness and injury in reduced-G? [ISS TBD, Lunar TBD, Mars TBD]
	19h	How do alterations in space flight-associated physiology interact across body systems? [ISS 4, Lunar 3, Mars 3]
	19i	Identify the appropriate informatics tools to automate monitoring crew health (i.e., prompting screening evaluations, off-nominal value detection, intelligent diagnostic work-up), in order to free-up crew time. [ISS 2, Lunar 1, Mars 1]
	Prophylaxis/Disease Prevention	
	19j	Identify the ideal set of nutritional and medical prophylaxis and primary and secondary preventive measures to reduce the risk of space illness. (such as medical countermeasures for known conditions e.g., bisphosphonates for loss of BMD). [ISS 3, Lunar 2, Mars 2]
	19k	Identify the primary, secondary and tertiary prevention strategies needed to mitigate the risk of anticipated environmental exposures to toxic substances and radiation.(i.e., shielding, nutritional and medical prophylaxis such as agents to augment cellular defenses, immune surveillance, etc.). [ISS 2, Lunar 1, Mars 1]
	19l	What are the essential technologies, resources, procedures, skills and training necessary to provide effective primary prevention strategies to mitigate each of the conditions listed in the SMCCB-approved Space Medicine Condition List (catalogued in the online Patient Condition Database)? [ISS 4, Lunar 3, Mars 2]
19m	What are the essential technologies, resources, procedures, skills and training necessary to provide effective secondary prevention strategies to mitigate each of the conditions listed in the SMCCB-approved Space Medicine Condition List (catalogued in the online Patient Condition Database)? [ISS 4, Lunar 3, Mars 2]

Risk Title: Major Illness & Trauma

Theme :	Autonomous Medical Care (AMC)				
Discipline :	Clinical capabilities				
Risk Number :	20				
Risk Description :	Major Illness & Trauma (Diagnosis, Management, CPR, BCLS, ACLS, BTLS, ATLS, DCS, Toxic Exposure- Detection and Management, Surgical Management, Medical Waste Management). There is a risk of major illness that increases with length of mission. There is always a risk of trauma, which can vary according to activities (e.g. construction, vehicle driving, etc.) Lack of capability to treat these major illnesses and injuries poses a threat to life and mission.				
Context/Risk Factors :	TBD				
RYG Risk Assessment :	<p>ISS: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Lunar: ■ Red Unacceptable risk of serious adverse health or performance consequences; there is no mitigation strategy that has been validated in space or demonstrated on Earth.</p> <p>Mars: ■ Red Unacceptable risk of serious adverse health or performance consequences; there is no mitigation strategy that has been validated in space or demonstrated on Earth.</p>

20a	What are the essential technologies, resources, procedures, skills and training necessary to provide effective tertiary prevention strategies to mitigate each of the conditions listed in the SMCCB-approved Space Medicine Condition List (catalogued in the online Patient Condition Database)? [ISS 3, Lunar 1, Mars 1]				

20b	Identify the technologies for employing decision support techniques for diagnostic assistance of the crew medical personnel, emphasizing autonomy in decision-making from ground resources and based on known space flight illnesses and injuries and expedition analog experience. [ISS 2, Lunar 1, Mars 1]
20c	Define the appropriate role and resources required for telemedical consultation for the diagnosis and management of major illnesses. [ISS 3, Lunar 2, Mars 1]
Major Illness Treatment	
20d	Identify and adapt for reduced-G operation the resources, procedures and technologies are required for treatment of major illnesses, emphasizing autonomy from ground resources and based on known space flight illnesses and injuries and expedition analog experience. [ISS 2, Lunar 1, Mars 1]
20e	Identify appropriate synergistic and alternative management strategies for reducing the morbidity of major illnesses during space flight. []
20f	What procedures and protocols are necessary for rehabilitation after an acute medical illness or trauma? [ISS 4, Lunar 3, Mars 1]
CPR/BCLS/ACLS (Cardiac Life Support)	
20g	What is the most effective means of conducting life support operations in the space flight milieu, to include identification and modification of the resources and procedures for reduced-G? [ISS 3, Lunar 2, Mars 1]
20h	Identify the optimal resources and procedures for post-resuscitation management of the ill/injured crewmember and modify for reduced-G operations. [ISS 2, Lunar 1, Mars 1]
Decompression Illness (DCS) & Other Environmental Illness	
20k	What is the most effective pre-EVA DCS prevention strategy to include pre-breathe with various gases, exercise and other medical measures? [ISS 5]
20l	What are the appropriate screening procedures to minimize predispositions for DCS? [ISS 4]
20m	Identify the resources and techniques for early diagnosis of DCS signs and symptoms, including the use of Doppler U/S and other bubble detection technologies. [ISS 4]
20n	What are the best methods for predicting DCS risk and for reducing the risk, based on understanding of the physiological mechanism for bubble formation and propagation, employing best available knowledge from flight and analog environment experience? [ISS 4]
20o	Identify and adapt for reduced-G operations the most effective yet energy and space-efficient, as well as safe means of managing DCS in the space flight milieu, including the use of hyperbaric oxygen delivery and other promising technology. [ISS 3, Lunar 2, Mars 1]
20p	What is the actual risk of space-related DCS? (from both de novo physiological causes and through acute environmental insult - e.g., leaking module or damaged EMU etc.?) [ISS 3, Lunar 3, Mars 3]
20q	What are the operational and medical impacts of off-nominal performance of DCS countermeasures? [ISS 4, Lunar 3, Mars 3]
20r	What are the risk factors that can increase the likelihood of DCS, such as the presence of Patent Foramen Ovale (PFO)? [ISS 4, Lunar 3, Mars 2]
20s	What is the likelihood of surviving an acute environmental insult severe enough to cause damage to the vehicle or spacesuit? [ISS 2, Lunar 2, Mars 2]
20t	Is it possible and what are the DCS risk mitigation options for interplanetary EVA (e.g., moon and Mars) given that a tri-gas breathing mixture including argon is present? [ISS 4, Lunar 4, Mars 4]
20u	What is the role of individual susceptibility, age and gender on the risk of DCS during NASA operations involving decompression? [ISS 4, Lunar 3, Mars 3]
20v	What are the available and new technologies needed to provide hyperbaric treatment options on the ISS and future habitats (or vehicles) beyond LEO (e.g., on the moon or Mars)? [ISS 3, Lunar 2, Mars 1]

20w	What is the correlation between the detection/existence of gas phase creation in the bloodstream and development of clinically significant DCS? [ISS 4, Lunar 3, Mars 3]
Toxic Exposure Detection	
20x	Identify the signs and symptoms secondary to toxic chemical exposure and radiation in reduced-G environments. [ISS 2, Lunar 1, Mars 1]
Toxic Exposure/Management	
20y	What are the resources and procedures for the mitigation of toxic exposures? [ISS 3, Lunar 1, Mars 1]
20z	What primary prevention strategies (such as crew screening and selection criteria) should be developed and implemented to identify individuals who are at increased risk for developing hypersensitivity or allergies to space flight compounds, exposures, or payloads? [ISS 3, Lunar 2, Mars 2]
20aa	What secondary prevention strategies (i.e., countermeasures) should be developed and implemented to prevent adverse reactions to toxic exposures (e.g., sleep, nutritional, medications, stress reduction, shielding, protective equipment, etc.)? [ISS 3, Lunar 2, Mars 2]
Surgical Management	
20bb	What are the resources and procedures needed for surgical management of illness and injury and major trauma? [ISS 3, Lunar 1, Mars 1]
20cc	What are the appropriate roles and resources required for telemedical consultation for the surgical management of major illnesses? [ISS 3, Lunar 2, Mars 1]
20dd	What are the issues surrounding wound care? [ISS 4, Lunar 2, Mars 2]
Medical Waste Management	
20ee	What are the most effective means of management and disposal of medical waste within the surgical milieu? [ISS 2, Lunar 1, Mars 1]
Drug Stowage/Utilization/Replenishment	
20i	What are the resources and procedures needed to perform basic and advanced management of trauma? [ISS 3, Lunar 1, Mars 1]
20j	What are resources required for telemedical consultation for the diagnosis and management of major trauma? [ISS 3, Lunar 2, Mars 1]

Risk Title: Human Performance Failure Due to Poor Psychosocial Adaptation

Theme :	Behavioral Health and Performance (BH&P)
Discipline :	Human Behavior & Performance and Space Human Factors (Cognitive)
Risk Number :	27
Risk Description :	Human performance failure due to problems associated with adapting to the space environment; poor interpersonal relationships and/or group dynamics; inadequate team cohesiveness; and poor pre-mission preparation.
Context/Risk Factors :	Boredom with available foodstuffs ; Crew autonomy and increased reliance on each other ; Crowding ; Distance from family and friends ; Duration of flight ; Incompatible crewmembers ; Interpersonal tensions ; Mechanical breakdowns ; Poor communications ; Scheduling constraints and requirements ; Sleep disturbances ; Social isolation
RYG Risk Assessment :	ISS: ■ Red Unacceptable risk of serious adverse health or performance consequences; there is no mitigation strategy that has been validated in space or demonstrated on Earth. Lunar: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space. Mars: ■ Red Unacceptable risk of serious adverse health or performance consequences; there is no mitigation strategy that has been validated in space or demonstrated on Earth.
Justification :	ISS: Moderate likelihood/high consequence risk with low risk mitigation status; Need to reduce probability of human error, performance and/or mission failure. Serious interpersonal conflicts have occurred in space flight. The failure of flight crews to cooperate and work effectively with each other or with flight controllers has been a periodic problem in both US and Russian space flight programs. Interpersonal distrust, dislike, misunderstanding and poor communication have led to potentially dangerous situations, such as crewmembers refusing to speak to one another during critical operations, or withdrawing from voice communications with ground controllers. Such problems of group cohesiveness have a high likelihood of occurrence in prolonged space flight and if not mitigated through prevention or intervention, they will pose grave risks to the mission. Lack of adequate personnel selection, team assembly, or training has been found to have deleterious effects on work performance in organizational research studies. Lunar: Moderate likelihood/high consequence risk with low risk mitigation status; Need to reduce probability of human error, performance and/or mission failure. Serious interpersonal conflicts have occurred in space flight. Risk Title: Human Performance Failure Due to Neurobehavioral Problems

Theme :	Behavioral Health and Performance (BH&P)
Discipline :	Human Behavior & Performance and Space Human Factors (Cognitive)
Risk Number :	28
Risk Description :	Human performance failure during missions due to such conditions as depression, anxiety, trauma or other neuropsychiatric, cognitive problems
Context/Risk Factors :	Clinical capabilities ; Concern about health or loss of life or mission failure ; Crowdedness ; Differential vulnerability to neurobehavioral problems ; Duration of flight ; Environmental health ; Immunodeficiency issues ; Loneliness and worry about family ; Neurovestibular problems ; Nutrition ; Prolonged isolation and confinement ; Radiation exposure ; Trauma from unexpected event
RYG Risk Assessment :	<p>ISS: ■ Red Unacceptable risk of serious adverse health or performance consequences; there is no mitigation strategy that has been validated in space or demonstrated on Earth.</p> <p>Lunar: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Mars: ■ Red Unacceptable risk of serious adverse health or performance consequences; there is no mitigation strategy that has been validated in space or demonstrated on Earth.</p>
Justification :	<p>ISS: Although infrequent, serious neurobehavioral problems involving stress and depression have occurred in space flight, especially during long-duration missions. In some of these instances, the distress has contributed to performance errors during critical operations, such as the collision of Progress into Mir during manual docking. In other instances, emotional problems led to changes in motivation, diet, sleep and exercise—all critical to behavioral and physical health in-flight. No matter how prepared crews are for long-duration flights, the US and Russian experiences reveal that at least some subset of astronauts will experience problems with their behavioral health, which will negatively affect their performance and reliability, posing risks both to individual crewmembers and to the mission. The IOM report, <i>Safe Passages</i>, notes that Earth analogue studies show an incidence rate ranging from 3 – 13 percent per person per year. The report transposes these figures to 6-7 person crew on a 3-year mission to determine that there is a not insignificant likelihood of psychiatric problems emerging (p.106).</p> <p>Lunar: Although infrequent, serious neurobehavioral problems involving stress and depression have occurred in space flight, especially during long-duration missions. Risk Title: Mismatch between Crew Cognitive Capabilities and Task Demands

Theme :	Behavioral Health and Performance (BH&P)
Discipline :	Human Behavior & Performance and Space Human Factors (Cognitive)
Risk Number :	29
Risk Description :	Human performance failure due to inadequate accommodation of human cognitive limitations and capabilities. If human cognitive performance capabilities are surpassed due to inadequate design of tools, interfaces, tasks or information support systems, mission failure or decreased effectiveness or efficiency may result. Identifying, locating, processing or evaluating information to make decisions and perform critical tasks in short time-frames in nominal and emergency situations, with limited crew size, relying on strictly local resources is extremely subject to human error.
Context/Risk Factors :	Blackouts ; Communications lags ; Mission duration ; Required levels of autonomy ; Time since training, time since last performing a task and level of support available from mission control on Earth are major factors that increase the probability of human error ; Very long crew return times requiring a 'stand and fight' response to any malfunction on the lunar or Martian surface are expected to increase the likelihood and severity of consequences of error due to forgetting knowledge, losing skills, or failing to find information and training materials in databases
RYG Risk Assessment :	<p>ISS: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Lunar: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Mars: ■ Red Unacceptable risk of serious adverse health or performance consequences; there is no mitigation strategy that has been validated in space or demonstrated on Earth.</p>
Justification :	<p>ISS: Crews require refresher training and information support systems for numerous tasks during 6 month missions. (Ev. Level 4) Psychological literature documents increases in error with time since learning and decreases in error with correctly practicing the task. (Evidence level 1) Failure to correctly follow procedures has leads to fatal accidents in commercial aviation, even with greatly over learned tasks. (NTSB Reports-Level 2?)</p> <p>Lunar: Crews require refresher training and information support systems for numerous tasks during 6 month missions. (Ev. Level 4) Psychological literature documents increases in error with time since learning and decreases in error with correctly practicing the task. (Evidence level 1) Failure to correctly follow procedures has leads to fatal accidents in commercial aviation, even with greatly over learned tasks. (NTSB Reports-Level 2?)</p> <p>Mars: Crews require refresher training and information support systems for numerous tasks during 6 month missions. (Ev. Level 4) Psychological literature documents increases in error with time since learning and decreases in error with correctly practicing the task. (Evidence level 1) Failure to correctly follow procedures has leads to fatal accidents in commercial aviation, even with greatly over learned tasks. (NTSB Reports-Level 2?)</p>
Current Countermeasures :	<p>ISS : Crew resilience is the countermeasure for schedule and interface problems ; Crewmembers absorb task and schedule impacts ; Mission Control provides training, information, procedures, etc. as required to support crew actions and decision-making</p> <p>Lunar : Crew resilience is the countermeasure for schedule and interface problems ; Crewmembers absorb task and schedule impacts ; Mission Control provides training, information, procedures, etc. as required to support crew actions and decision-making</p> <p>Mars : Crew resilience is the countermeasure for schedule and interface problems ; Crewmembers absorb task and schedule impacts ; Mission Control provides training, information, procedures, etc. as required to support crew actions and decision-making</p>

<p>Projected Countermeasures :</p>	<p>ISS : Design requirements for communications systems among crewmembers, between crew and mission control and among crew and intelligent agents that reduce risk of mission failure ; Onboard training systems that enable successful readiness to perform ; Tools for analyzing tasks to identify critical skills and knowledge ; Tools for enabling crew autonomy with respect to information retrieval ; Tools to enable self-assessment of readiness to perform</p> <p>There is inadequate data to enable developing realistic workloads and schedules for tasks to be performed in space contexts</p> <p>Lunar : Design requirements for communications systems among crewmembers, between crew and mission control and among crew and intelligent agents that reduce risk of mission failure ; Onboard training systems that enable successful readiness to perform ; Tools for analyzing tasks to identify critical skills and knowledge ; Tools for enabling crew autonomy with respect to information retrieval ; Tools to enable self-assessment of readiness to perform</p> <p>There is inadequate data to enable developing realistic workloads and schedules for tasks to be performed in space contexts</p> <p>Mars : Design requirements for communications systems among crewmembers, between crew and mission control and among crew and intelligent agents that reduce risk of mission failure ; Onboard training systems that enable successful readiness to perform ; Tools for analyzing tasks to identify critical skills and knowledge ; Tools for enabling crew autonomy with respect to information retrieval ; Tools to enable self-assessment of readiness to perform</p> <p>There is inadequate data to enable developing realistic workloads and schedules for tasks to be performed in space contexts</p>

Risk Title: Human Performance Failure Due to Sleep Loss and Circadian Rhythm Problems

Theme :	Behavioral Health and Performance (BH&P)
Discipline :	Human Behavior & Performance and Space Human Factors (Cognitive)
Risk Number :	30
Risk Description :	Human performance failure due to disruption of circadian phase, amplitude, period or entrainment and/or human performance failure due to acute or chronic degradation of sleep quality or quantity
Context/Risk Factors :	Artificial and transmitted ambient light exposure ; Individual differences in vulnerability to sleep loss and circadian dynamics ; Work shift and sleep schedules

RYG Risk Assessment :	<p>ISS: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Lunar: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p>
Justification :	<p>ISS: High likelihood/high consequence risk with high risk mitigation status; Need to reduce probability of human error, performance and/or mission failure. Loss of circadian entrainment to Earth-based light-dark cycles and chronic reduction of sleep duration in space result in fatigue and jeopardize astronaut performance. Fatigue is a common symptom in prolonged space flight and every study of sleep in space, including those on US, Russian and European astronauts, has found that daily sleep is reduced to an average of 6 hours and even less when critical operations occur such as during nighttime Shuttle docking on ISS or during an emergency (e.g., equipment failure). Astronaut sleep in space is also physiologically altered and the most frequent medications taken in-flight by astronauts are hypnotics for sleep disturbances. Extensive ground-based scientific evidence documents that circadian disruptions and restriction of sleep at levels commonly experienced by astronauts can severely diminish cognitive performance capability, posing risks to individual astronaut safety and mission success.</p> <p>Lunar: High likelihood/high consequence risk with high risk mitigation status; Need to reduce probability of human error, performance and/or mission failure. Risk Title: Carcinogenesis

Theme :	Radiation Health
Discipline :	Radiation Health
Risk Number :	31
Risk Description :	Unacceptable levels of increased cancer morbidity or mortality risk in astronauts caused by occupational radiation exposure or the combined effects of radiation and other space flight factors. These risks would be expressed following the mission (late).
Context/Risk Factors :	Microgravity ; Physiological changes ; Radiation (space, medical diagnostic, atmospheric, experimental and nuclear sources including propulsion systems) and synergistic effects of radiation with other space flight factors including stress
RYG Risk Assessment :	<p>ISS: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Lunar: ■ Red Unacceptable risk of serious adverse health or performance consequences; there is no mitigation strategy that has been validated in space or demonstrated on Earth.</p> <p>Mars: ■ Red Unacceptable risk of serious adverse health or performance consequences; there is no mitigation strategy that has been validated in space or demonstrated on Earth.</p>

Justification :	ISS: Crew Health and Performance Post-Mission Lunar: Crew Health and Performance Post-Mission Mars: Crew Health and Performance Post-Mission																												
Current Countermeasures :	ISS : Polyethylene shielding Lunar : Polyethylene shielding Mars : Polyethylene shielding																												
Projected Countermeasures :	ISS : Hydrogenous shielding ; Anti-oxidants ; Gene therapy ; Pharmaceuticals Lunar : Hydrogenous shielding ; Anti-oxidants ; Gene therapy ; Pharmaceuticals Mars : Hydrogenous shielding ; Anti-oxidants ; Gene therapy ; Pharmaceuticals

Risk Title: Acute and Late CNS Risks

Theme :	Radiation Health
Discipline :	Radiation Health
Risk Number :	32

Risk Description :	Damage to the central nervous system (CNS) leading to unacceptable levels of risk for changes in motor function and behavior, or neurological disorders caused by occupational radiation exposure or the combined effects of radiation and other space flight factors. These risks can be manifested during an extended mission (acute), or following return to Earth (late).																
Context/Risk Factors :	Microgravity ; Physiological changes ; Radiation (space, medical diagnostic, atmospheric, experimental and nuclear sources including propulsion systems) and synergistic effects of radiation with other space flight factors including stress																
RYG Risk Assessment :	<p>ISS: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Lunar: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.</p> <p>Mars: ■ Red Unacceptable risk of serious adverse health or performance consequences; there is no mitigation strategy that has been validated in space or demonstrated on Earth.</p>																
Justification :	<p>ISS: Crew Health and Performance In-Flight and Post-Mission</p> <p>Lunar: Crew Health and Performance In-Flight and Post-Mission</p> <p>Mars: Crew Health and Performance In-Flight and Post-Mission</p>																
Current Countermeasures :	<p>ISS : Polyethylene shielding</p> <p>Lunar : Polyethylene shielding</p> <p>Mars : Polyethylene shielding</p>																
Projected Countermeasures :	<p>ISS : Hydrogenous shielding ; Anti-oxidants ; Gene therapy ; Pharmaceuticals</p> <p>Lunar : Hydrogenous shielding ; Anti-oxidants ; Gene therapy ; Pharmaceuticals</p> <p>Mars : Hydrogenous shielding ; Anti-oxidants ; Gene therapy ; Pharmaceuticals</p>

No.	Question												
33a	What are the probabilities for degenerative tissue risks from protons and HZE ions as a function of NASA's operational parameters (age at exposure, age and time after exposure, gender, tissue, mission, radiation quality, dose rate)? [ISS 2, Lunar 2, Mars 1]												
33b	What are the mechanisms of degenerative tissues risks in the heart, circulatory, endocrine, digestive, lens and other tissue systems? [ISS 2, Lunar 2, Mars 1]												
33c	How can the latency period for degenerative tissue risks, including sub-clinical diseases, following space radiation exposures be estimated? [ISS 3, Lunar 3, Mars 1]												
33d	What are the most effective biomedical or dietary countermeasures to degenerative tissue risks? By what mechanisms do the countermeasures work? [ISS 3, Lunar 3, Mars 1]												
33e	What quantitative procedures or theoretical models are needed to extrapolate molecular, cellular, or animal results to predict degenerative tissue risks in astronauts? How can human epidemiology data best support these procedures or models? [ISS 4, Lunar 4, Mars 2]

Risk Title: Heredity, Fertility and Sterility Risks

Theme :	Radiation Health
Discipline :	Radiation Health
Risk Number :	34
Risk Description :	Unacceptable levels of increased hereditary, fertility, or sterility risk caused by occupational radiation exposure or the combined effects of radiation and other space flight factors. These decrements can be following return to Earth (late), or in the progeny of astronauts (for hereditary risks).
Context/Risk Factors :	Microgravity ; Physiological changes ; Radiation (space, medical diagnostic, atmospheric, experimental and nuclear sources including propulsion systems) and synergistic effects of radiation ; Stress
RYG Risk Assessment :	<p>ISS: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p> <p>Lunar: ■ Green Health and performance consequences are known or suspected, but will not affect mission success due to effective mitigation strategies that have been validated in space.</p>

	Mars: ■ Yellow High risk of serious health or performance consequences; there is no mitigation strategy that has been validated in space.						
Justification :	ISS: Crew Health and Performance Post-Mission Lunar: Crew Health and Performance Post-Mission Mars: Crew Health and Performance Post-Mission						
Current Countermeasures :	ISS : Family counseling ; Polyethylene shielding Lunar : Family counseling ; Polyethylene shielding Mars : Family counseling ; Polyethylene shielding						
Projected Countermeasures :	ISS : Hydrogenous shielding ; Anti-oxidants ; Gene therapy ; Pharmaceuticals Lunar : Hydrogenous shielding ; Anti-oxidants ; Gene therapy ; Pharmaceuticals Mars : Hydrogenous shielding ; Anti-oxidants ; Gene therapy ; Pharmaceuticals						
Enabling Questions [With Mission Priority]:	<table border="1"> <thead> <tr> <th>No.</th> <th>Question</th> </tr> </thead> <tbody> <tr> <td>34a</td> <td>What are the risks of hereditary, fertility or sterility effects as a result of exposure to space radiation? Risk Title: Monitor Air Quality

Theme :	Advanced Human Support Technologies (AHST)
Discipline :	Advanced Environmental Monitoring & Control (AEMC)
Risk Number :	36
Risk Description :	Lack of timely information about the buildup of chemicals, pre-combustion reaction products, malfunction of life support equipment, or other events (e.g., accidental release from an experiment) can lead to delayed response by crew or by automated equipment resulting in a hazard to the crew.
Context/Risk Factors :	Accidental event such as fire or leak ; Malfunction in life support system which may be gradual or sudden
RYG Risk Assessment :	<p>ISS: ■ Yellow Considerable potential for improvement in mitigation efficiency in a few areas.</p> <p>Lunar: ■ Red Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.</p> <p>Mars: ■ Red Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.</p>
Justification :	<p>ISS: The time constant for measurement varies widely depending on the cause. Gradual buildup of toxic chemicals may take months, calling for highly sensitive detection at slow intervals, perhaps daily. Leakage or pre-combustion events are expected to occur more rapidly, requiring more rapid detection (minutes), though less sensitive detection may be necessary. Localized information is needed to identify the problem source. Existing technology for ground-based measurement is massive, power hungry and requires significant crew skill and time. No single technology currently can address all Space Maximum Allowable Concentration SMAC chemicals. Combustion in micro, lunar and Martian gravity is very different from combustion on Earth and has different pre-combustion indicators. Harmful foreign matter may be inadvertently brought in following extravehicular activity (EVA) and should be monitored prior to cabin entry as well as inside the habitat. The same monitoring technology may be useful for helping diagnose crew health by providing breath monitoring data.</p> <p>Lunar: The time constant for measurement varies widely depending on the cause. Risk Title: Monitor Surfaces Food and Soil

Theme :	Advanced Human Support Technologies (AHST)
Discipline :	Advanced Environmental Monitoring & Control (AEMC)
Risk Number :	39
Risk Description :	Lack of timely information, or failure to detect the presence of harmful chemicals or microbial growth on surfaces, food supplies or soil required for plant growth can pose a crew health hazard.
Context/Risk Factors :	Low or microgravity allows for greater accumulation of liquids on surfaces by surface tension and longer persistence of matter suspended in air, increased the likelihood of surface impact
RYG Risk Assessment :	<p>ISS: ■ Yellow Considerable potential for improvement in mitigation efficiency in a few areas.</p> <p>Lunar: ■ Red Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.</p> <p>Mars: ■ Red Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.</p>
Justification :	<p>ISS: The area of contamination of surfaces in the space environment has received relatively little attention to date. The risk is essentially unknown.</p> <p>Lunar: The area of contamination of surfaces in the space environment has received relatively little attention to date. The risk is essentially unknown.</p> <p>Mars: The area of contamination of surfaces in the space environment has received relatively little attention to date. The risk is essentially unknown.</p>
Current Countermeasures :	<p>ISS : Occasional manual plate culturing of samples from swabbed surfaces</p> <p>Lunar : Occasional manual plate culturing of samples from swabbed surfaces</p> <p>Mars : Occasional manual plate culturing of samples from swabbed surfaces</p>
Projected Countermeasures :	<p>ISS : Detection and identification of surface contamination by optical interrogation ; Reliable, repeatable sampling methods taking minimal crew time</p> <p>Lunar : Detection and identification of surface contamination by optical interrogation ; Reliable, repeatable sampling methods taking minimal crew time</p> <p>Mars : Detection and identification of surface contamination by optical interrogation ; Reliable, repeatable</p>

Risk Title: Provide Integrated Autonomous Control of Life Support Systems

Theme :	Advanced Human Support Technologies (AHST)										
Discipline :	Advanced Environmental Monitoring & Control (AEMC)										
Risk Number :	40										
Risk Description :	Lack of stable, reliable, efficient process control for the life support system.										
Context/Risk Factors :	Decreasing life support system mass by decreasing air or water buffer sizes (an economically desirable objective) increases potential for system to become unstable ; Longer mission time such as Martian scenario means greater potential for life support system to become unstable										
RYG Risk Assessment :	<p>ISS: ■ Green Minimum or limited potential for improvement in mitigation efficiency</p> <p>Lunar: ■ Yellow Considerable potential for improvement in mitigation efficiency in a few areas.</p> <p>Mars: ■ Red Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.</p>										
Justification :	<p>ISS: Automated control of life support is needed to minimize the crew workload. Industrial process control technology is manufacturing-oriented (input/output) with a narrow range of time constants. Space life support is an endless loop-recycling environment, with time constants ranging from fast accidental incidents to life cycles of plant crops (months). Advances in process control technology are needed for safe, efficient control of the life support system.</p> <p>Lunar: Automated control of life support is needed to minimize the crew workload. Risk Title: Provide Space Suits and Portable Life Support Systems

Theme :	Advanced Human Support Technologies (AHST)
Discipline :	Advanced Extravehicular Activity (AEVA)
Risk Number :	41
Risk Description :	Inability to provide a robust EVA system that provides the life support resources, mobility and ancillary support, including robotics interactions and airlock design, to perform defined mission EVA tasks.

Context/Risk Factors :	Accommodation for waste including potential for emissions ; CO2 removal system consumption ; Dust contamination ; Power consumption ; Suit pressure ; Thermal comfort consumables, increased carry weight																		
RYG Risk Assessment :	<p>ISS: ■ Green Minimum or limited potential for improvement in mitigation efficiency</p> <p>Lunar: ■ Yellow Considerable potential for improvement in mitigation efficiency in a few areas.</p> <p>Mars: ■ Red Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.</p>																		
Justification :	<p>ISS: Long-duration in Martian partial Gravity leads to increased hardware use. Hardware failures could occur without the capability for equipment servicing and overhaul. Dust contamination leads to equipment failures and decreased suit mobility from contaminated bearings and joints.</p> <p>Lunar: Long-duration in Martian partial Gravity leads to increased hardware use. Risk Title: Maintain Food Quantity and Quality

Theme :	Advanced Human Support Technologies (AHST)
Discipline :	Advanced Food Technology (AFT)
Risk Number :	42
Risk Description :	If the food system is inadequate for the mission, then crew nutritional requirements may not be met and crew health and performance will suffer. An inadequate food system is one that is unsafe provides food that fails to meet nutritional requirements or is unacceptable from a sensory standpoint.
Context/Risk Factors :	Below standard food intakes ; Chemical or microbial contamination of food ; Crew psychological and physiological changes ; Elevated stress and boredom ; Inadequate food packaging ; Inadequate food processing/preservation ; Inadequate quantity of food ; Inadequate shelf life ; Inadequate storage conditions and environmental control ; Inadequate variety ; Product formulation ; Undefined nutritional requirements
RYG Risk Assessment :	ISS: ■ Yellow Considerable potential for improvement in mitigation efficiency in a few areas. Lunar: ■ Green Minimum or limited potential for improvement in mitigation efficiency Mars: ■ Red Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.
Justification :	ISS: Food provides the crew with the required nutritional daily intake. In addition, food through its variety and acceptability provides a psychosocial component by decreasing stress during a mission. An inadequate food supply will lead to unhealthy crewmembers hence resulting in a compromised mission through reduced crew performance. Lunar: Food provides the crew with the required nutritional daily intake. In addition, food through its variety and acceptability provides a psychosocial component by decreasing stress during a mission. An inadequate food supply will lead to unhealthy crewmembers hence resulting in a compromised mission through reduced crew performance. Mars: Food provides the crew with the required nutritional daily intake. In addition, food through its variety and acceptability provides a psychosocial component by decreasing stress during a mission. An inadequate food supply will lead to unhealthy crewmembers hence resulting in a compromised mission through reduced crew performance.
Current Countermeasures :	ISS : Hazard analysis critical control point processing ; Increased menu cycle ; Increased variety of menu

	<p>items ; Menu developed based on daily nutritional requirements ; Testing and evaluation ; Vitamin D supplementation</p> <p>Lunar : Hazard analysis critical control point processing ; Increased menu cycle ; Increased variety of menu items ; Menu developed based on daily nutritional requirements ; Testing and evaluation ; Vitamin D supplementation</p> <p>Mars : Hazard analysis critical control point processing ; Increased menu cycle ; Increased variety of menu items ; Menu developed based on daily nutritional requirements ; Testing and evaluation ; Vitamin D supplementation</p>																										
Projected Countermeasures :	<p>ISS : Assessment of food psychosocial importance ; Determine effects of radiation on food ; Development of extended shelf life food through improved food preservation technologies ; Enhanced food system with increased variety and acceptability ; Hazard analysis critical control point processing ; High barrier and low mass food packaging materials ; Refined nutritional requirements</p> <p>Lunar : Assessment of food psychosocial importance ; Determine effects of radiation on food ; Development of extended shelf life food through improved food preservation technologies ; Enhanced food system with increased variety and acceptability ; Hazard analysis critical control point processing ; High barrier and low mass food packaging materials ; Refined nutritional requirements</p> <p>Mars : Assessment of food psychosocial importance ; Determine effects of radiation on food ; Development of extended shelf life food through improved food preservation technologies ; Enhanced food system with increased variety and acceptability ; Hazard analysis critical control point processing ; High barrier and low mass food packaging materials ; Refined nutritional requirements</p>

Risk Title: Maintain Acceptable Atmosphere

Theme :	Advanced Human Support Technologies (AHST)
Discipline :	Advanced Life Support (ALS)

Risk Number :	43										
Risk Description :	Inability to control atmosphere concentration CO ₂ , O ₂ and trace contaminants in habitable areas (excessive airborne chemical pollutants e.g., formaldehyde, ethylene glycol, freon from leaks, fires, etc.) including microbial contaminants (microbial degradation of biological wastes).										
Context/Risk Factors :	Complexity of systems and increase in the number of systems (e.g., additional solid waste processing, plant growth, food processing, etc. for what?) ; Insensitivity of control system to contaminants leading to toxic build ups due to a closed system ; Remoteness ; Severely constrained resources (such as mass, power, volume, thermal, crew time)										
RYG Risk Assessment :	<p>ISS: ■ Green Minimum or limited potential for improvement in mitigation efficiency</p> <p>Lunar: ■ Yellow Considerable potential for improvement in mitigation efficiency in a few areas.</p> <p>Mars: ■ Red Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.</p>										
Justification :	<p>ISS: The inability to control and condition the atmosphere and maintain the makeup & composition, limits the ability of the crew to perform basic functions and can present an immediate threat to the health, life and success of crew and mission.</p> <p>Lunar: The inability to control and condition the atmosphere and maintain the makeup & composition, limits the ability of the crew to perform basic functions and can present an immediate threat to the health, life and success of crew and mission.No rapid return capability (days)</p> <p>Mars: The inability to control and condition the atmosphere and maintain the makeup & composition, limits the ability of the crew to perform basic functions and can present an immediate threat to the health, life and success of crew and mission. No rapid return capability (months)</p>										
Current Countermeasures :	<p>ISS : Looking at potentially more robust methods of removing CO₂ and combining functions for air management ; Regenerable Trace Contaminant Control System (TCCS) development (testing, modeling) ; Resupply ; Technology development to further close the air loop and increase carbon dioxide reduction. This includes testing, modeling and analysis</p> <p>Lunar : Development in new sorbent technology, application in CO₂ Moisture Removal System (CMRS), an open loop system ; Limited resupply ; Model and analysis trade of technology ; Regenerable Trace Contaminant Control System (TCCS)</p> <p>Mars : Analysis to identify projected contaminant sources from other systems ; Compressor technology applicable also for ISRU ; Extremely limited resupply ; Looking at potentially more robust methods of removing CO₂ and combining functions for air management ; Regenerable Trace contaminant control (testing, modeling) ; Technology development to further close the air loop and increase carbon dioxide reduction. This includes testing, modeling and analysis</p>										
Projected Countermeasures :	<p>ISS : Regenerable TCCS ; Improved Carbon Dioxide Removal and Reduction System– [TRL 3, 4]</p> <p>Lunar : Bioregenerative Life Support ; ISRU ; Look to have better models identifying contaminant load ; CMRS</p> <p>Mars : Bioregenerative Life Support ; ISRU ; Regenerable TCCS ; Improved Carbon Dioxide Removal and Reduction System [TRL 3, 4]</p>

Risk Title: Maintain Thermal Balance in Habitable Areas

Theme :	Advanced Human Support Technologies (AHST)
Discipline :	Advanced Life Support (ALS)
Risk Number :	44
Risk Description :	Inability to acquire, transport and reject waste heat from life support systems reliably and efficiently with minimum power, mass and volume. Capability is crucial to enabling extended human exploration of space.
Context/Risk Factors :	Location on planetary surface ; Orientation of the vehicle during flight ; Orientation of vehicle and/or habitat on planetary surface ; Planetary environment (temperature ranges & extremes, dust, seasonal variations, etc.) ; Sources of heat from other elements of the mission ; Use or availability of local planetary resources
RYG Risk Assessment :	<p>ISS: ■ Green Minimum or limited potential for improvement in mitigation efficiency</p> <p>Lunar: ■ Yellow Considerable potential for improvement in mitigation efficiency in a few areas.</p> <p>Mars: ■ Red</p>

	Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.																
Justification :	ISS: Humans cannot live and work on Mars without a thermally controlled environment. Lunar: Humans cannot live and work on Mars without a thermally controlled environment. Mars: Humans cannot live and work on Mars without a thermally controlled environment.																
Current Countermeasures :	ISS : Thermal control systems have been a mandatory system on every space vehicle that has ever flown Lunar : Thermal control systems have been a mandatory system on every space vehicle that has ever flown Mars : Thermal control systems have been a mandatory system on every space vehicle that has ever flown																
Projected Countermeasures :	ISS : Several advances are underway to improve the reliability and life, or decrease the mass, volume, or power required for thermal control system hardware. [TRL 3-6] Lunar : Several advances are underway to improve the reliability and life, or decrease the mass, volume, or power required for thermal control system hardware. [TRL 3-6] Mars : Several advances are underway to improve the reliability and life, or decrease the mass, volume, or power required for thermal control system hardware. [TRL 3-6]

Risk Title: Manage Waste

Theme :	Advanced Human Support Technologies (AHST)	
Discipline :	Advanced Life Support (ALS)	
Risk Number :	45	
Risk Description :	Inability to adequately process solid wastes reliably with minimum power, mass, volume and consumables can harm to crew health and safety. Inadequate waste management can also lead to contamination of planetary surfaces or significant increases in mission costs in terms of system mass, power, volume and consumables.	
Context/Risk Factors :	Crew health/susceptibility to degree of system closure, mission duration, microgravity environment ; Failure of other systems such as diminished or failed power supply ; Remoteness	
RYG Risk Assessment :	ISS: ■ Green Minimum or limited potential for improvement in mitigation efficiency Lunar: ■ Yellow Considerable potential for improvement in mitigation efficiency in a few areas. Mars: ■ Red Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.	
Justification :	ISS: Inadequate waste management can lead to harm to crew health and safety including reduced performance, sickness and death. Inadequate waste management can also lead to contamination of planetary surfaces or significant increases in mission costs in terms of system mass, power, volume and consumables. Lunar: Inadequate waste management can lead to harm to crew health and safety including reduced performance, sickness and death. Inadequate waste management can also lead to contamination of planetary surfaces or significant increases in mission costs in terms of system mass, power, volume and consumables. Mars: Inadequate waste management can lead to harm to crew health and safety including reduced performance, sickness and death. Inadequate waste management can also lead to contamination of planetary surfaces or significant increases in mission costs in terms of system mass, power, volume and consumables.	
Current Countermeasures :	ISS : Adsorbents are used for odor control ; Crew manually compacts waste and/or stores waste in bags ; Feces is mechanically compacted ; Waste is returned in the Shuttle for disposal or returned in logistics modules to be destroyed on entry Lunar : Adsorbents are used for odor control ; Crew manually compacts waste and/or stores waste in bags ; Feces is mechanically compacted ; Return of waste is unlikely and overboard disposal is not currently developed as an option for a Lunar or Mars mission. Other countermeasures are not currently developed Mars : Adsorbents are used for odor control ; Crew manually compacts waste and/or stores waste in bags ; Feces is mechanically compacted ; Return of waste is unlikely and overboard disposal is not currently developed as an option for a Lunar or Mars mission. Other countermeasures are not currently developed	
Projected Countermeasures :	ISS : Current practice though less than optimum may be adequate for the life of ISS Lunar : Provide a system for adequately collecting waste . ; Provide a system for adequately transporting waste ; Provide a system for processing waste for storage , resource recovery or disposal of trash generated (including clothing) throughout the mission, reliably and efficiently with minimum power, mass and volume. Mars : Provide a system for adequately collecting waste . ; Provide a system for adequately transporting waste ; Provide a system for processing waste for storage , resource recovery or disposal of trash generated (including clothing) throughout the mission, reliably and efficiently with minimum power, mass and volume.	
Enabling Questions [With Mission Priority]:	No.	Question
	45a	What system will meet the storage and/or disposal requirements for specified missions? [ISS 1, Lunar 1, Mars 1]

	45b	What system will meet requirements for processing wastes to recover resources for specified missions? [ISS 1, Lunar 1, Mars 1]
	45c	What waste management will handle complex waste streams such as packaging, paper, etc. in order to meet mission requirements? [ISS 2, Lunar 2, Mars 2]
	45d	What waste management will handle medical wastes such as blood, tissues and syringes etc. in order to meet mission requirements? [Lunar 2, Mars 2]
	45e	What system will separate wastes (inedible plant biomass, trash and/or paper, feces, etc.) in order to meet compatibility mission requirements for waste management? [ISS 1, Lunar 1, Mars 1]
	45f	What system will meet the requirements for managing residuals for planetary protection? [Lunar 2, Mars 2]
	45g	How can microbes and candidate crop species be engineered to perform better and fulfill multiple functions in a bioregenerative system? [Lunar 3, Mars 1]
	45h	What are the interfaces between the biological and physical chemical life support subsystems for a specified mission? [Lunar 3, Mars 1]
	45i	Can viability and genetic integrity of the biological components be maintained for the duration of different missions? [Lunar 3, Mars 2]
	45j	How do partial and microgravity affect biological waste processing? [Lunar 3, Mars 1]
	45k	What are the effects of radiation on biological components of the life support system? [Lunar 3, Mars 1]
	45l	What sensors are required to monitor performance and provide inputs to control systems (AEMC)? [ISS 2, Lunar 2, Mars 2]
	45m	What monitoring and control system can provide semi to total autonomous control to relieve the crew of monitoring and control functions to the extent possible (AEMC)? [ISS 2, Lunar 2, Mars 2]
	45n	Could any of the solid waste be recycled in such a way to provide building material for habitability features needed in subsequent phases of the mission? [Lunar 3, Mars 3]
	45o	What research is required to validate design approaches for multiphase flows for solid waste management and resource recovery in varying gravity environments. [Lunar TBD, Mars TBD]
	45p	What resources are required to manage waste disposal as an environmental risk during long and remote missions (from EH)? [ISS TBD, Lunar TBD, Mars TBD]

Risk Title: Provide and Maintain Bioregenerative Life Support Systems

Theme :	Advanced Human Support Technologies (AHST)
Discipline :	Advanced Life Support (ALS)
Risk Number :	46

Risk Description :	Inability (with minimal or no re-supply) to provide adequate fresh food products, assimilate carbon dioxide, produce oxygen and recycle solid and liquid wastes at the levels of performance required for a specified mission due to lack of bio-regenerative subsystems integrated with other physical and chemical life support systems.														
Context/Risk Factors :	Effect of radiation on plants ; For some scenarios, reduced atmospheric pressure ; For some scenarios, reduced sunlight ; Limited availability of water ; Limits on power availability for artificial lighting ; Reduced gravity ; Remoteness														
RYG Risk Assessment :	<p>ISS: ■ Green Minimum or limited potential for improvement in mitigation efficiency</p> <p>Lunar: ■ Yellow Considerable potential for improvement in mitigation efficiency in a few areas.</p> <p>Mars: ■ Red Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.</p>														
Justification :	<p>ISS: Risk to mission success relatively low. Resupply line is short and resources limited for bioregenerative systems. Possible decrease in crew performance without biological systems.</p> <p>Lunar: Necessary to sustain long-term habitats on Lunar surface due to distance required for resupply.</p> <p>Mars: Risk to mission success is high. Very high life support requirement masses necessary for Martian habitat. Bioregenerative systems only means of producing food and primary contributor for CO₂ removal, O₂ production and H₂O purification and achieving high degree of autonomy</p>														
Current Countermeasures :	<p>ISS : Development of Vegetable Production Unit ; Fresh fruit and vegetables included on current resupply missions to ISS ; Screen acceptable cultivars for space systems</p> <p>Lunar : Closed system testing (BPC) to identify area requirement for food, water, O₂. Screen / develop acceptable cultivars ; Development of Vegetable Production Unit for use with partial Gravity ; Telescience and robotic management of cropping systems</p> <p>Mars : Atmospheric pressure limitations to production being determined ; Conduct long-duration tests to assess reliability ; Develop surface deployable systems ; Materials for Martian greenhouse being evaluated ; Mixed cropping systems for continuous production under long-duration missions being tested ; Screen / develop acceptable cultivars ; VPU for salad crop production during transit</p>														
Projected Countermeasures :	<p>ISS : Provide Vegetable Production Unit for ISS</p> <p>Lunar : Mixed cropping systems for continuous production evaluated ; Scale gravity based salad production module to meet all water and partial O₂ and food requirements for surface mission</p> <p>Mars : Integrated Bioregenerative / PC test bed ; Low pressure Martian greenhouse ; Scale system to meet all O₂, CO₂ requirements for surface habitat and meet partial food requirements</p>

Risk Title: Provide and Recover Potable Water

Theme :	Advanced Human Support Technologies (AHST)
Discipline :	Advanced Life Support (ALS)
Risk Number :	47
Risk Description :	If there is an inability to provide and recover potable water from human-generated wastewaters, then a potable water shortage may exist. Lack of potable water is a risk to crew health.
Context/Risk Factors :	Crew health/susceptibility to degree of system closure ; Remoteness
RYG Risk Assessment :	ISS: ■ Green Minimum or limited potential for improvement in mitigation efficiency Lunar: ■ Yellow Considerable potential for improvement in mitigation efficiency in a few areas. Mars: ■ Red

	Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.																										
Justification :	<p>ISS: Lack of potable water is a health risk.</p> <p>Lunar: Lack of potable water is a health risk. Lack of immediate resupply and increased reliance on water recovery systems compounds risk.</p> <p>Mars: Lack of potable water is a health risk. Lack of resupply and increased reliance on water recovery systems greatly compounds risk.</p>																										
Current Countermeasures :	<p>ISS : Resupply possible ; Stored potable water ; Water recovery system performance monitored</p> <p>Lunar : Minimal stored potable water ; Water recovery system performance monitored</p> <p>Mars : Minimal stored potable water ; Water recovery system performance monitored</p>																										
Projected Countermeasures :	<p>ISS : Possibility of in situ resource utilization (cannot assign TRL until presence of water is confirmed) ; Biological systems ; Redundant systems</p> <p>Lunar : Possibility of in situ resource utilization (cannot assign TRL until presence of water is confirmed) ; Biological systems ; Redundant systems</p> <p>Mars : Possibility of in situ resource utilization (cannot assign TRL until presence of water is confirmed) ; Biological systems ; Redundant systems</p>

Risk Title: Inadequate Mission Resources for the Human System

Theme :	Advanced Human Support Technologies (AHST)
Discipline :	Cross Discipline
Risk Number :	48
Risk Description :	Lack of low mass, low power, low consumable, highly reliable, low maintenance solutions to human support systems can lead to excessive mission costs.
Context/Risk Factors :	
RYG Risk Assessment :	<p>ISS: ■ Yellow Considerable potential for improvement in mitigation efficiency in a few areas.</p> <p>Lunar: ■ Red Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.</p> <p>Mars: ■ Red Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.</p>
Justification :	<p>ISS: Human support and monitoring equipment must be sufficiently low in mass and power requirements to be affordable to launch. Reagents and other system consumables needs must be low and nonhazardous. Crew training and maintenance must be low, or the human support technology will not be used properly, increasing the risks. Anecdotal evidence suggests that crew training may be behind the difficulties in water sampling and analysis—some are able to figure out how to remove bubbles; others are not.</p> <p>Lunar: Human support equipment must be sufficiently low in mass and power requirements to be affordable to launch. Reagent and other consumable needs must be low and nonhazardous. Crew training and maintenance must be low, or the technology may not be used properly. Analytical capability must be provided in situ, because samples can't be returned to Earth readily</p> <p>Mars: Human support equipment must be sufficiently low in mass and power requirements to be affordable to launch. Risk Title: Mismatch between Crew Physical Capabilities and Task Demands

Theme :	Advanced Human Support Technologies (AHST)
Discipline :	Space Human Factors Engineering
Risk Number :	49
Risk Description :	Human performance failure due to habitats, work environments, workplaces, equipment, protective clothing, tools and tasks, not designed to accommodate human physical limitations, including changes in crew capabilities resulting from mission and task duration factors, leading to loss of mission, crew injury or illness or reduced effectiveness or efficiency in nominal or predictable emergency situations.
Context/Risk Factors :	Design constraints ; Gravitational loads ; Human physical performance capability deteriorates with lack of stimulation (such as gravity and practice), under adverse physical contexts (stabilization, restrictive clothing, thermal stress etc.) and under task stress conditions that lead to fatigue, sleep loss etc ; Lack of exercise and specific training countermeasures ; Temporal factors
RYG Risk Assessment :	ISS: ■ Green Minimum or limited potential for improvement in mitigation efficiency Lunar: ■ Yellow Considerable potential for improvement in mitigation efficiency in a few areas. Mars: ■ Red Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.
Justification :	ISS:

	<p>Crew accommodations are designed based primarily on volume and mass considerations. Anecdotal information from crew reports and extrapolations from physiological studies is available on impacts of habitats, work environments, workplaces, equipment, protective clothing, tools and tasks on human performance in space contexts. There is inadequate data on physical performance changes in strength, stamina and motor skill as functions of time in micro-g. Returning crewmembers usually exhibit substantial physical and motor deficits.</p> <p>Lunar: Very limited anecdotal information is available on impacts of habitats, work environments, workplaces, equipment, protective clothing, tools and tasks on human performance in lunar contexts. There is inadequate data on physical performance changes in strength, stamina and motor skill as functions of time in reduced G and while wearing protective clothing.</p> <p>Mars: No information is available on impacts of habitats, work environments, workplaces, equipment, protective clothing, tools and tasks on human performance in long-duration space contexts. There is minimal data on physical performance changes in strength, stamina and motor skill as functions of time in reduced-g.</p>																						
<p>Current Countermeasures :</p>	<p>ISS : Appropriate mission design ; Crew ‘resiliency ; Crew training</p> <p>Lunar : Appropriate mission design ; Crew ‘resiliency ; Crew training</p> <p>Mars : Appropriate mission design ; Crew ‘resiliency ; Crew training</p>																						
<p>Projected Countermeasures :</p>	<p>ISS : Measurement, analysis, modeling and design tools for optimizing environment , habitat, workplace, equipment, protective clothing and task design. ; Tools for analyzing physical tasks to determine allocations of functions between humans and machines.</p> <p>Lunar : Measurement, analysis, modeling and design tools for optimizing environment , habitat, workplace, equipment, protective clothing and task design. ; Tools for analyzing physical tasks to determine allocations of functions between humans and machines.</p> <p>Mars : Measurement, analysis, modeling and design tools for optimizing environment , habitat, workplace, equipment, protective clothing and task design. ; Tools for analyzing physical tasks to determine allocations of functions between humans and machines.</p>

Risk Title: Mis-assignment of Responsibilities within Multi-agent Systems

Theme :	Advanced Human Support Technologies (AHST)
Discipline :	Space Human Factors Engineering
Risk Number :	50
Risk Description :	If multi-agent systems, including ground support, crewmembers and intelligent devices are designed and assigned functions and responsibilities without due regard to human capabilities and limitations, mission degradation or failure will result. Various combinations of agents are required to accomplish mission objectives.
Context/Risk Factors :	Lag times of 20 minutes, or communications blackout, can remove one potential agent (Mission Control) ; Risk of failure to successfully perform multi-agent tasks increases with time since training, and with decrements in communications ; Very long crew return times requiring a 'stand and fight' response to any malfunction on the lunar or Mars surface increases the likelihood and severity of consequences of failure to complete tasks due to inadequate task design and planning
RYG Risk Assessment :	<p>ISS: ■ Yellow Considerable potential for improvement in mitigation efficiency in a few areas.</p> <p>Lunar: ■ Yellow Considerable potential for improvement in mitigation efficiency in a few areas.</p> <p>Mars: ■ Red Considerable potential for improvement in mitigation efficiency in many areas; proposed missions may be infeasible without improvements.</p>
Justification :	<p>ISS: Inadequate design of human-automation systems is known to leads to human error, based on analysis of incidents in the nuclear power industry and commercial aviation. (Ev. Level 3) "Mode error" has resulted in fatal accidents in commercial aviation. (Ev Level 2) At least two critical collisions between ISS and SRMS have been avoided only by real-time monitoring and intervention by MCC. (Level 4)</p> <p>Lunar: Inadequate design of human-automation systems is known to leads to human error, based on analysis of incidents in the nuclear power industry and commercial aviation. (Ev. Level 3) "Mode error" has resulted in fatal accidents in commercial aviation.
